Screenshot review pack

18 captured states across six flows. Use the sequence to review information hierarchy, labels, layout, sharing and save behavior.

1. Accounts & invitations — pages 2-4

2. Sharing & recipient editing — pages 5-6

3. Agents: connect, preview, apply, reverse — pages 7-12

4. Local saves & window closing — pages 13-15

5. Offline typing, quit & reconnect — pages 16-18

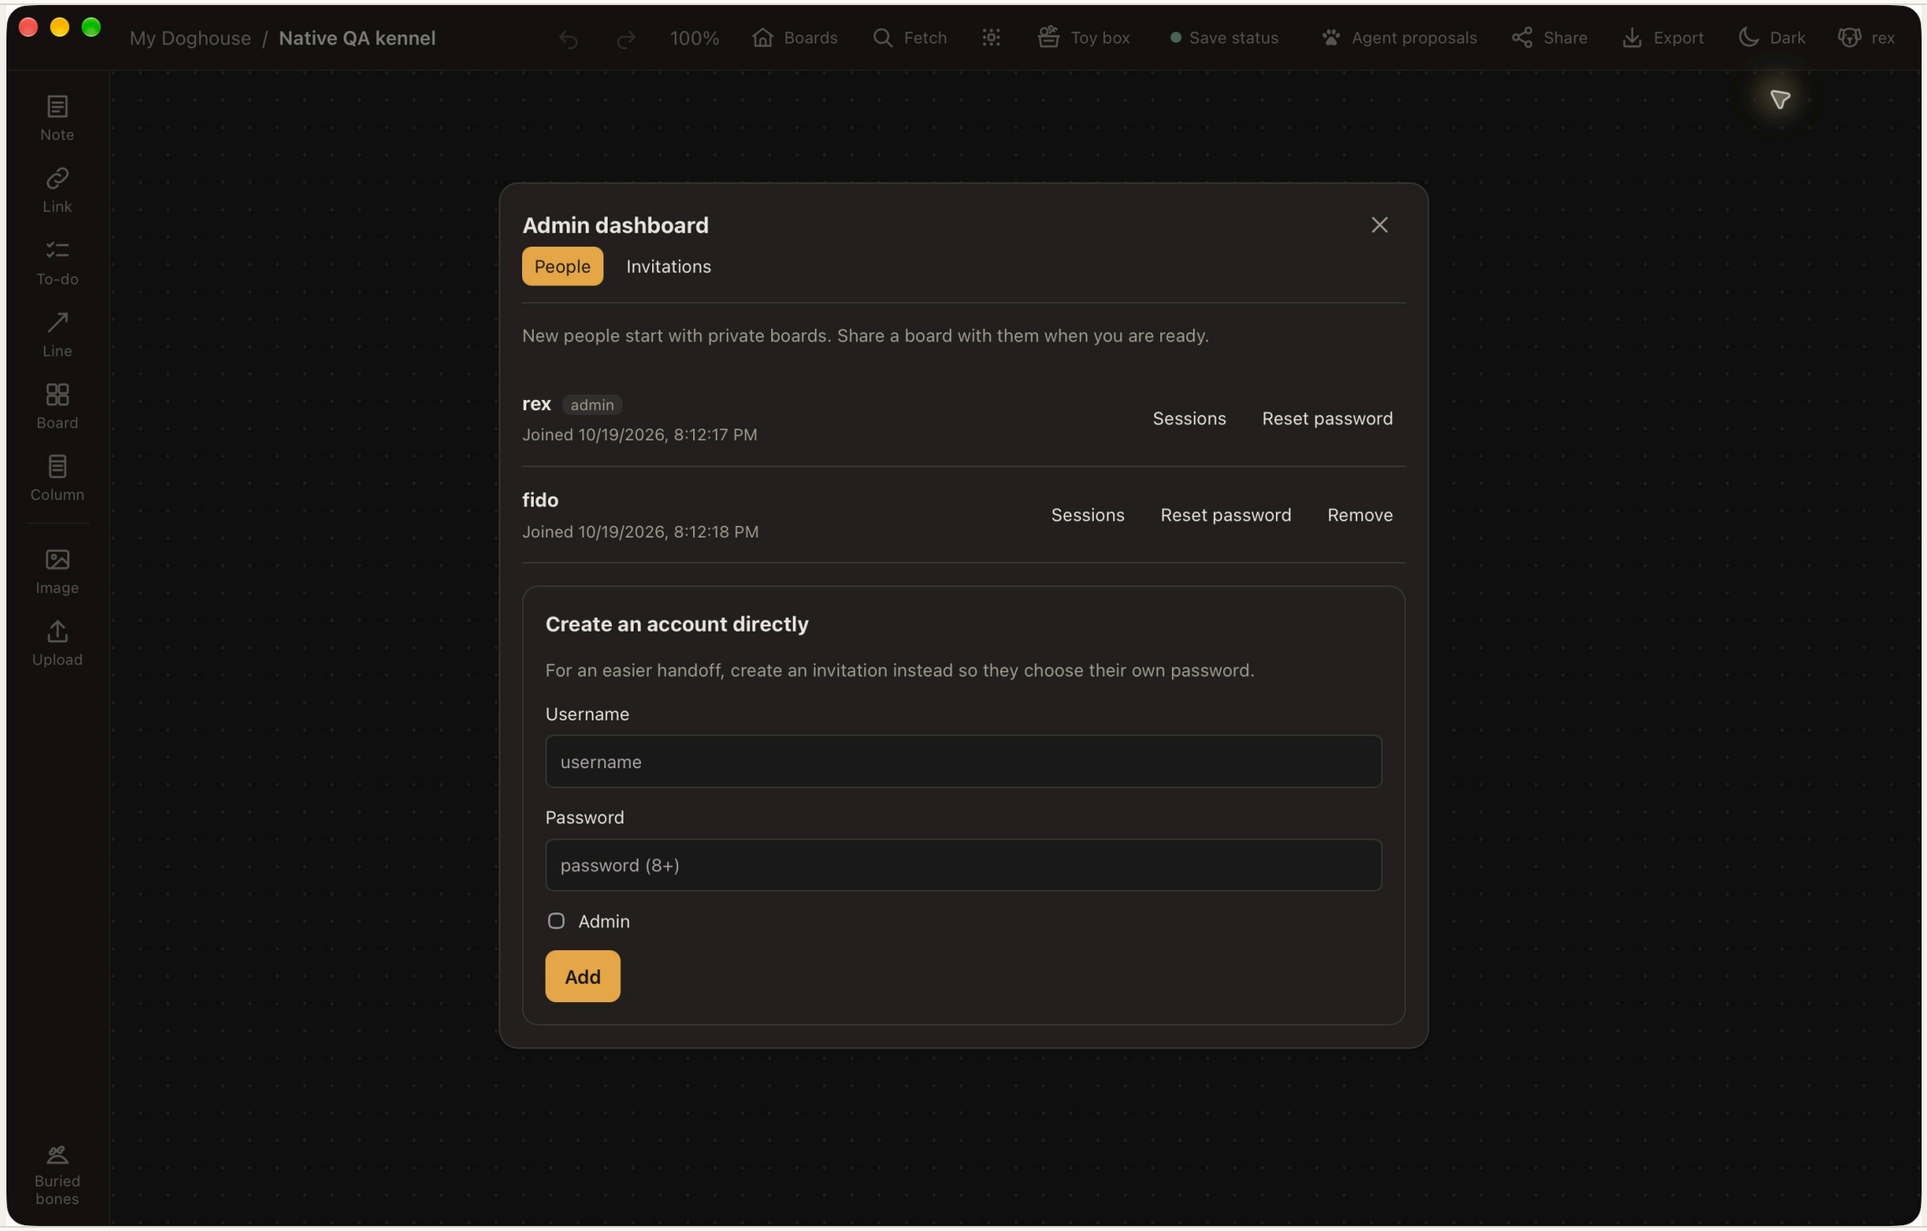

6. Recovery copy — pages 19-19

Captured from isolated local QA accounts. These are screenshots of observed states, not recordings. Intermediate invitation/join forms, board double-click timing, animations and the removed badge do not have dedicated before/after sequences.

Each screenshot has a caption and a review note. Native preview 07 was captured before the final preview text-contrast fix; browser views 10-11 use final-run captures. Refer to screenshot numbers when sharing feedback.

Manage people

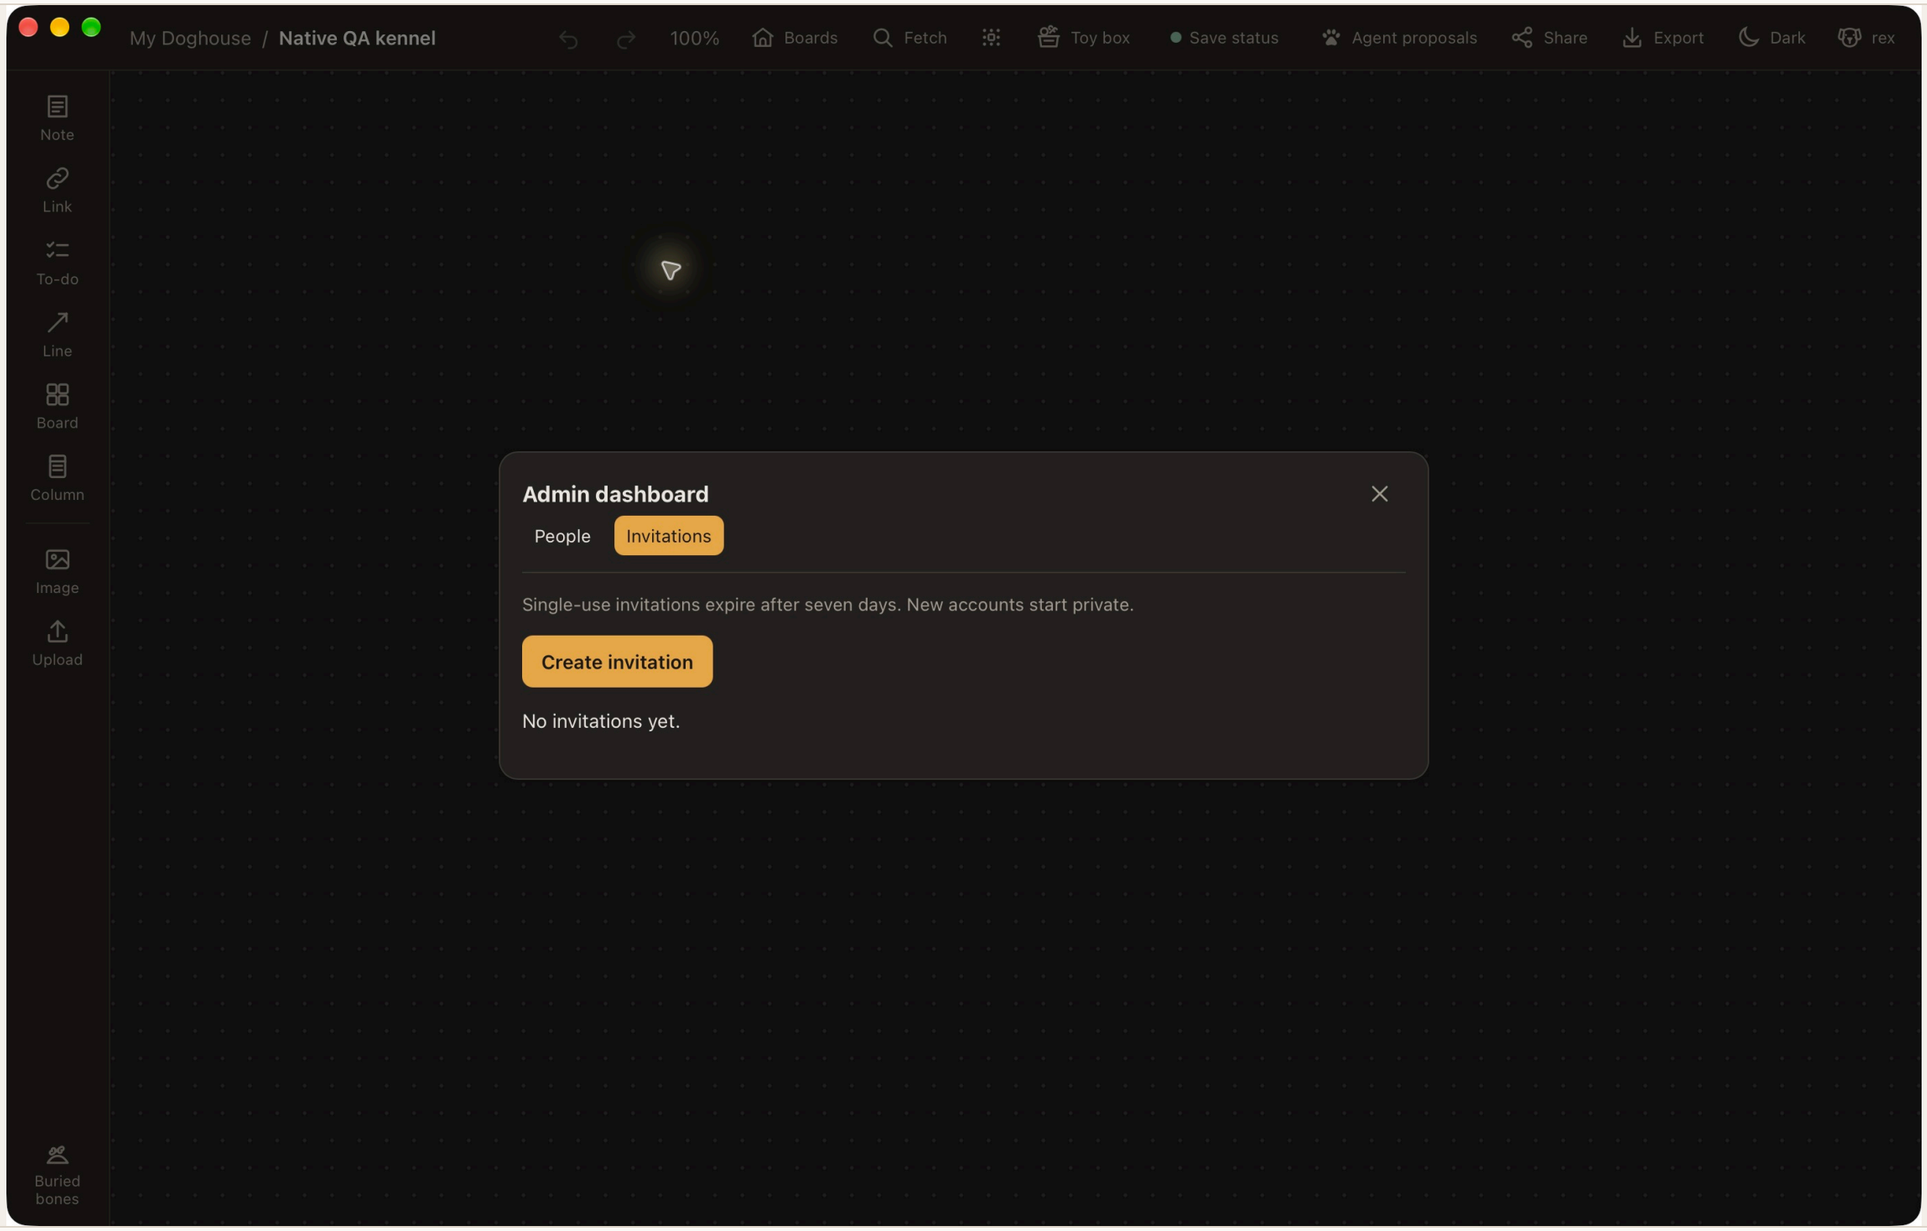

The People tab groups account creation, password recovery and session controls.

Check whether the main actions are easy to find.

Create an invitation

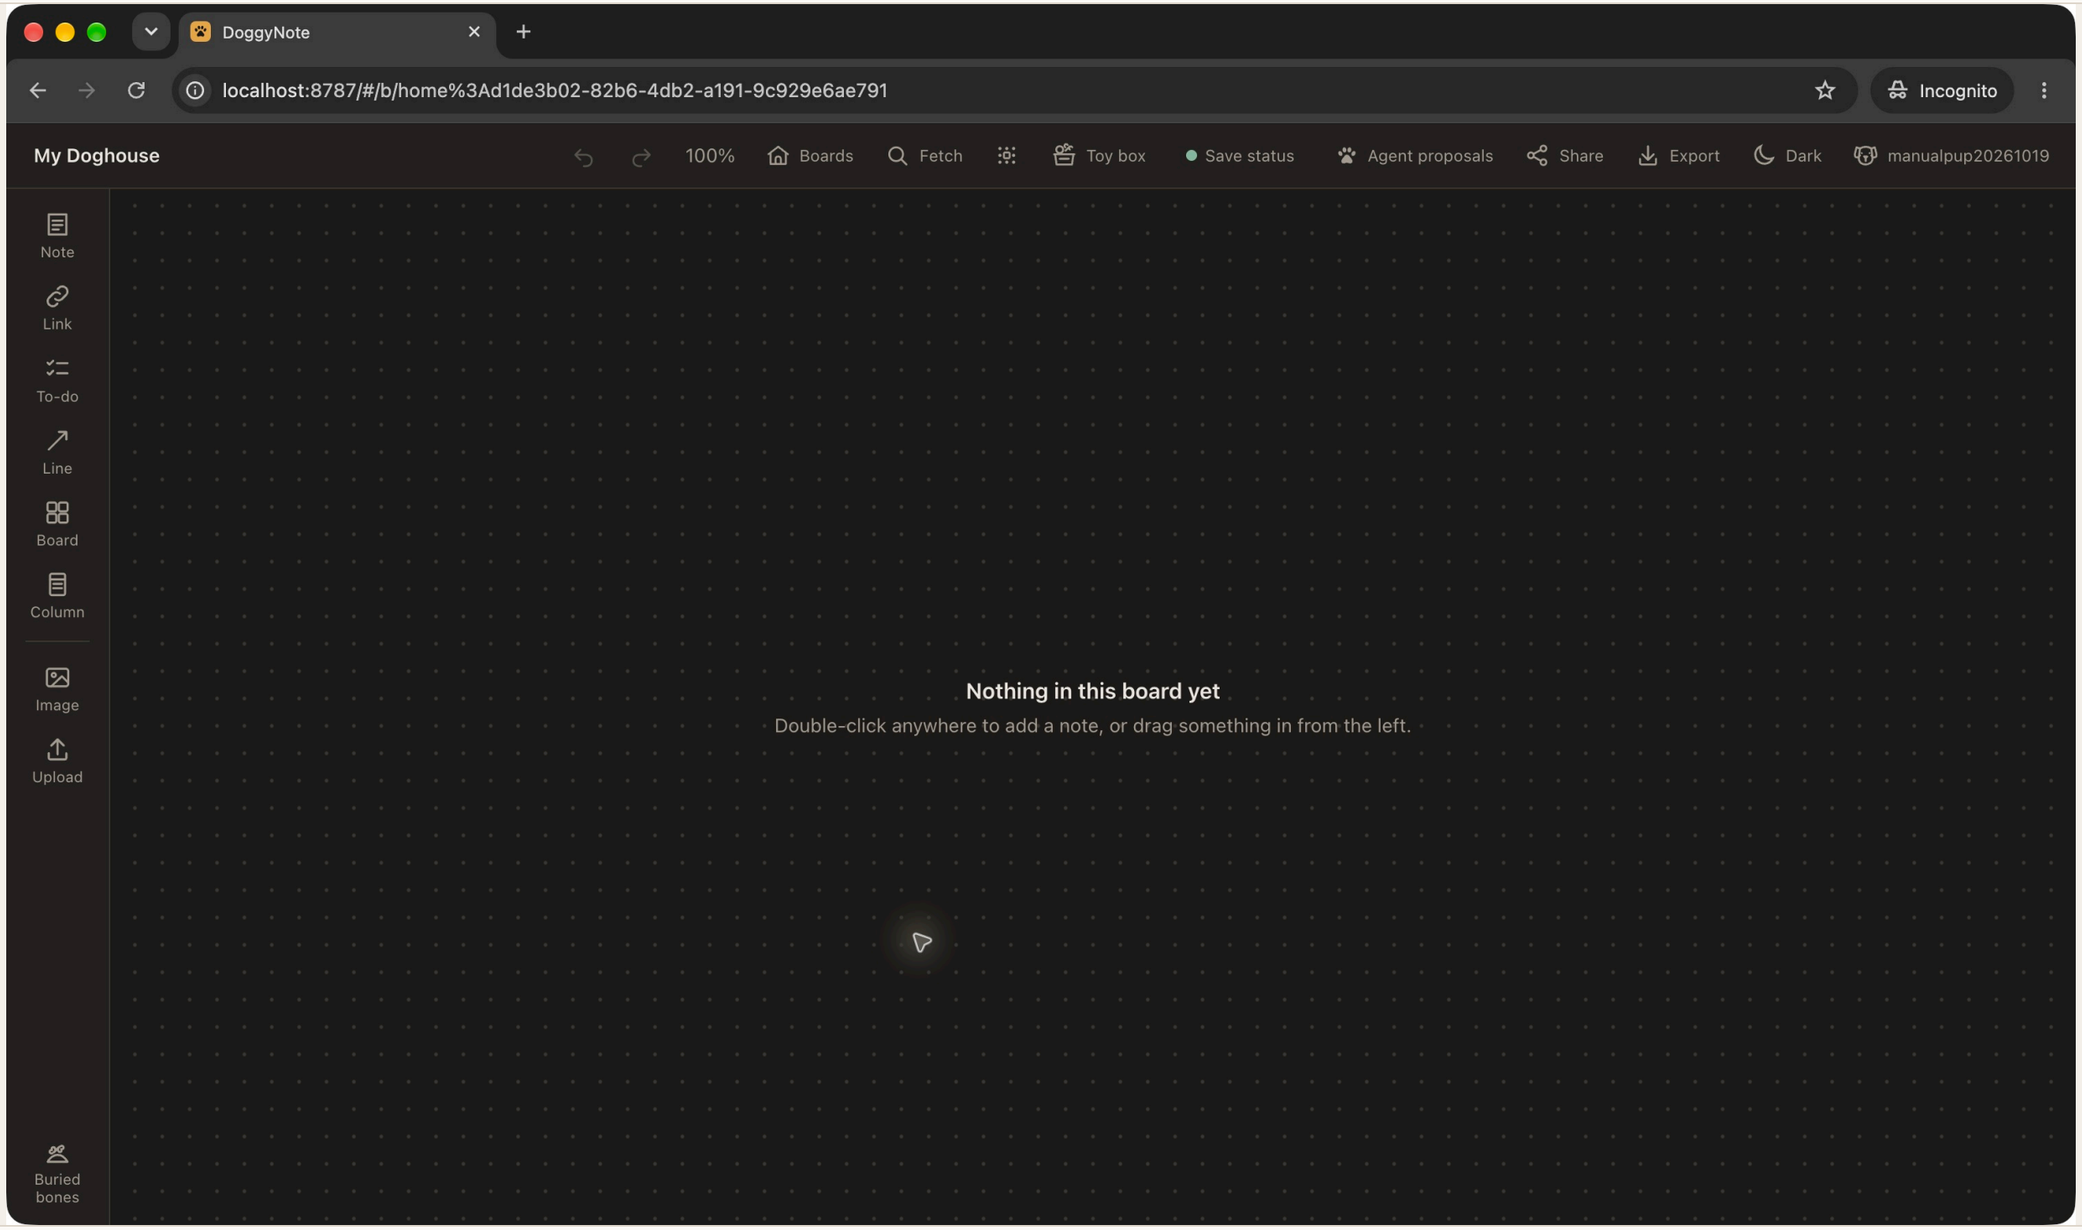

The Invitations tab explains the seven-day, single-use invitation and its empty state.

The generated-link and signup-form screens were not captured.

Arrive in a private home

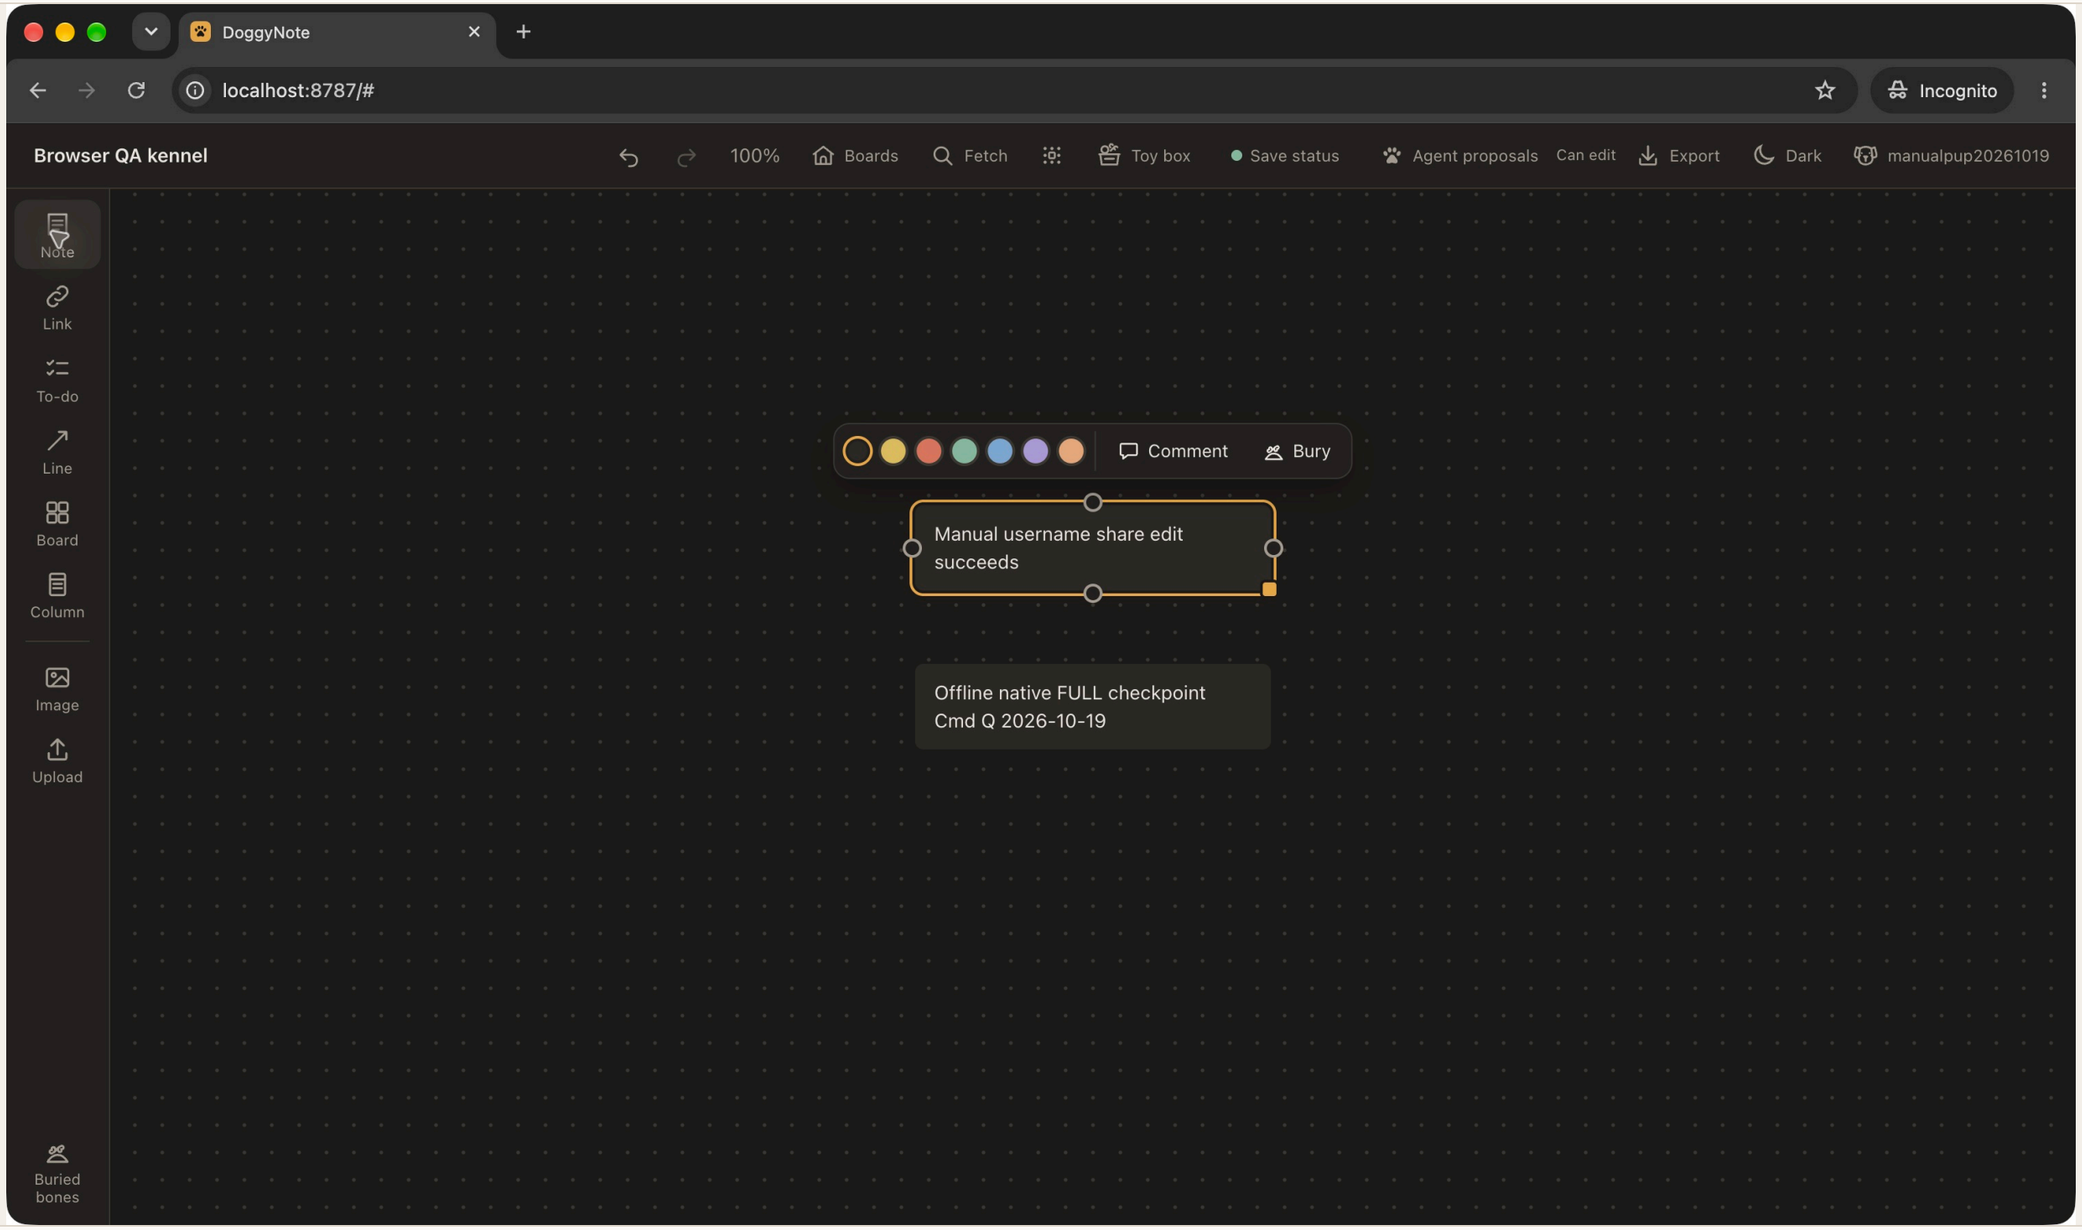

A recipient followed an invitation, chose credentials and landed in an empty personal home.

New accounts start without access to the legacy shared space.

Edit after a username invitation

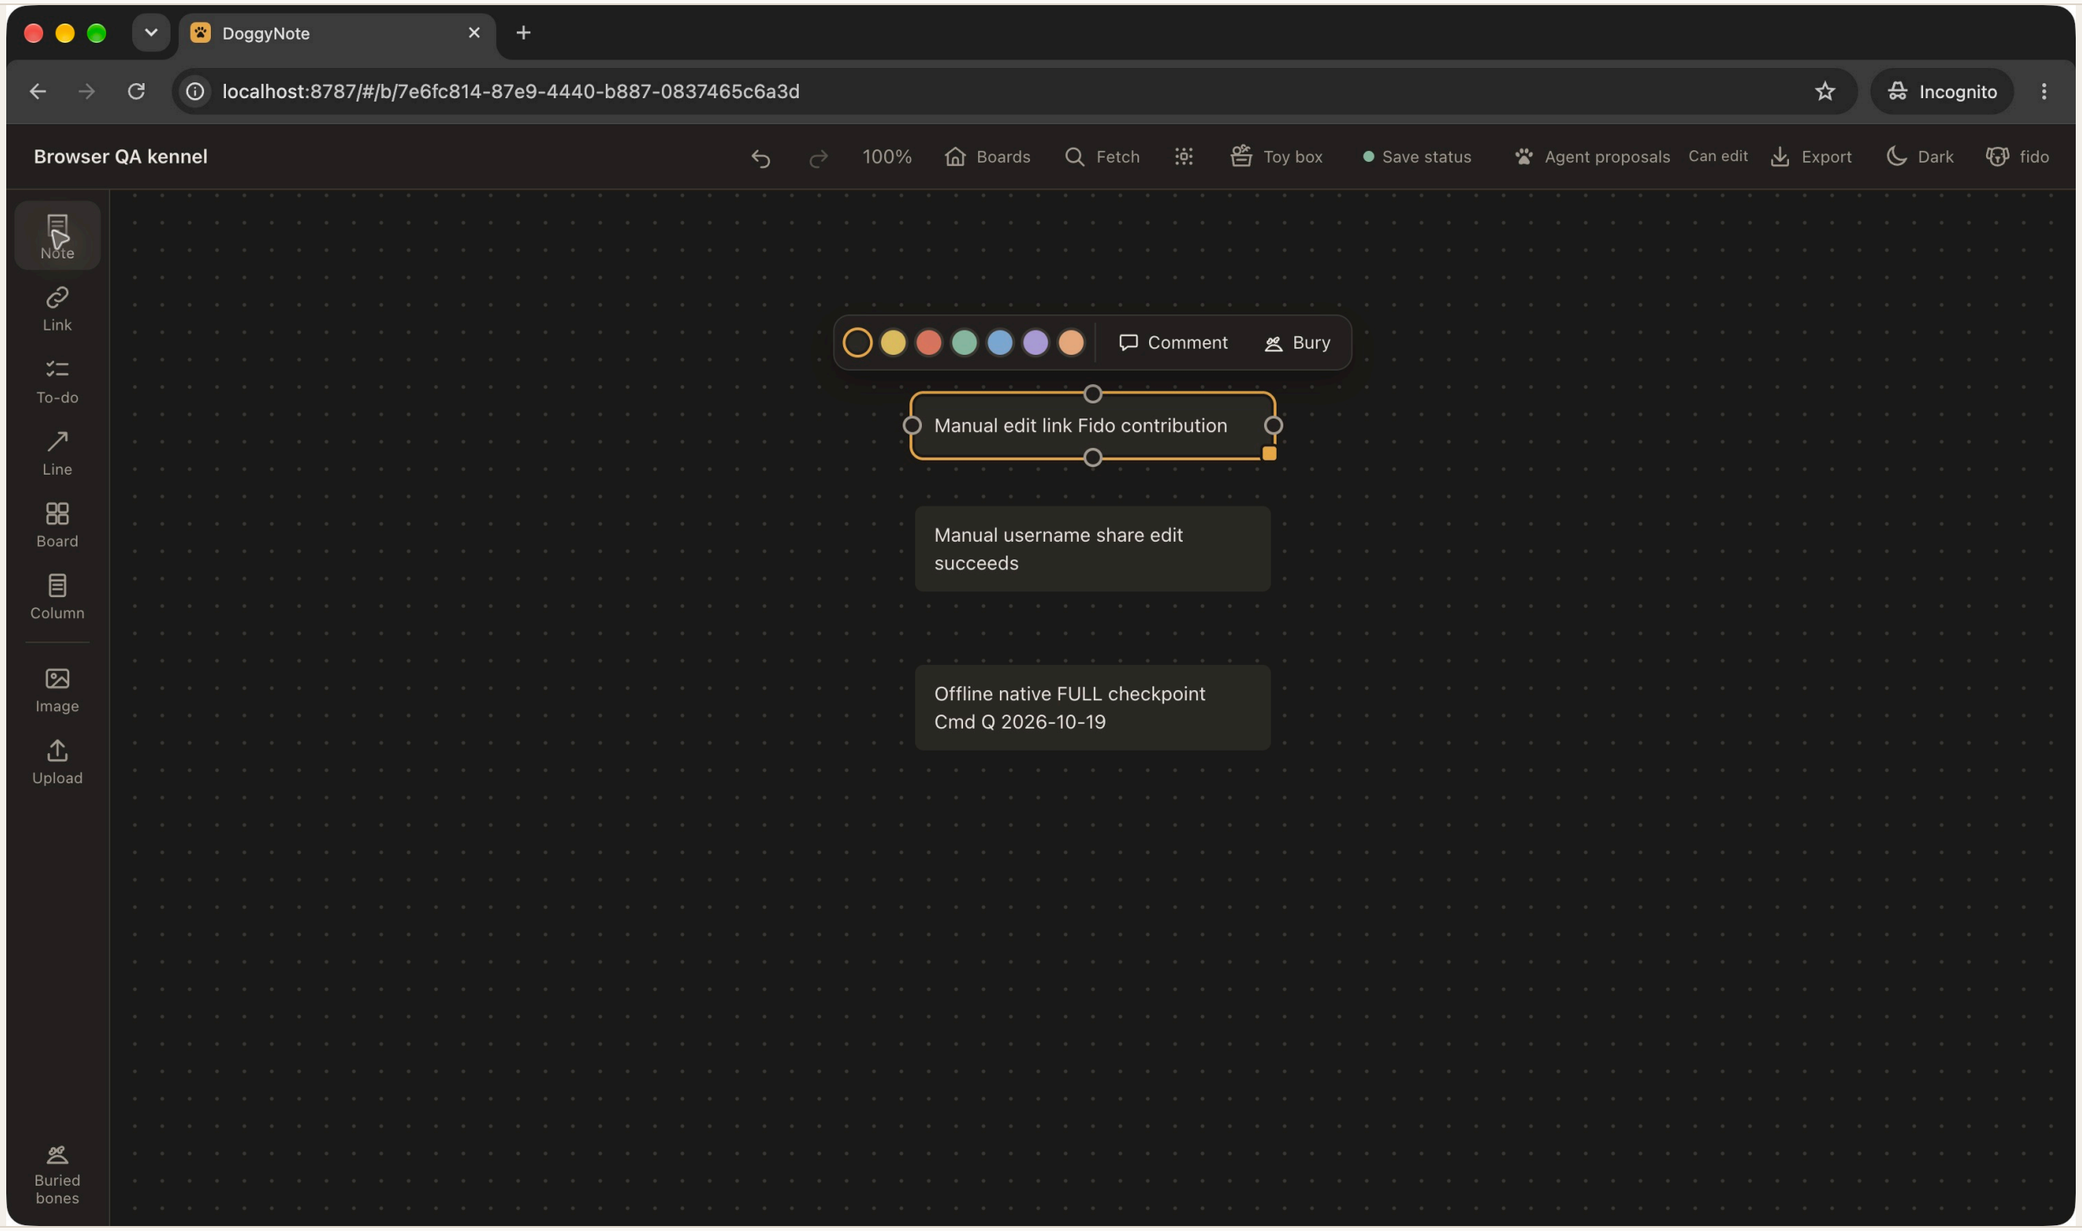

The owner granted editing access by username. The recipient signed in and created the visible note.

Look at the Can edit label and the available editing tools.

Edit after accepting a link

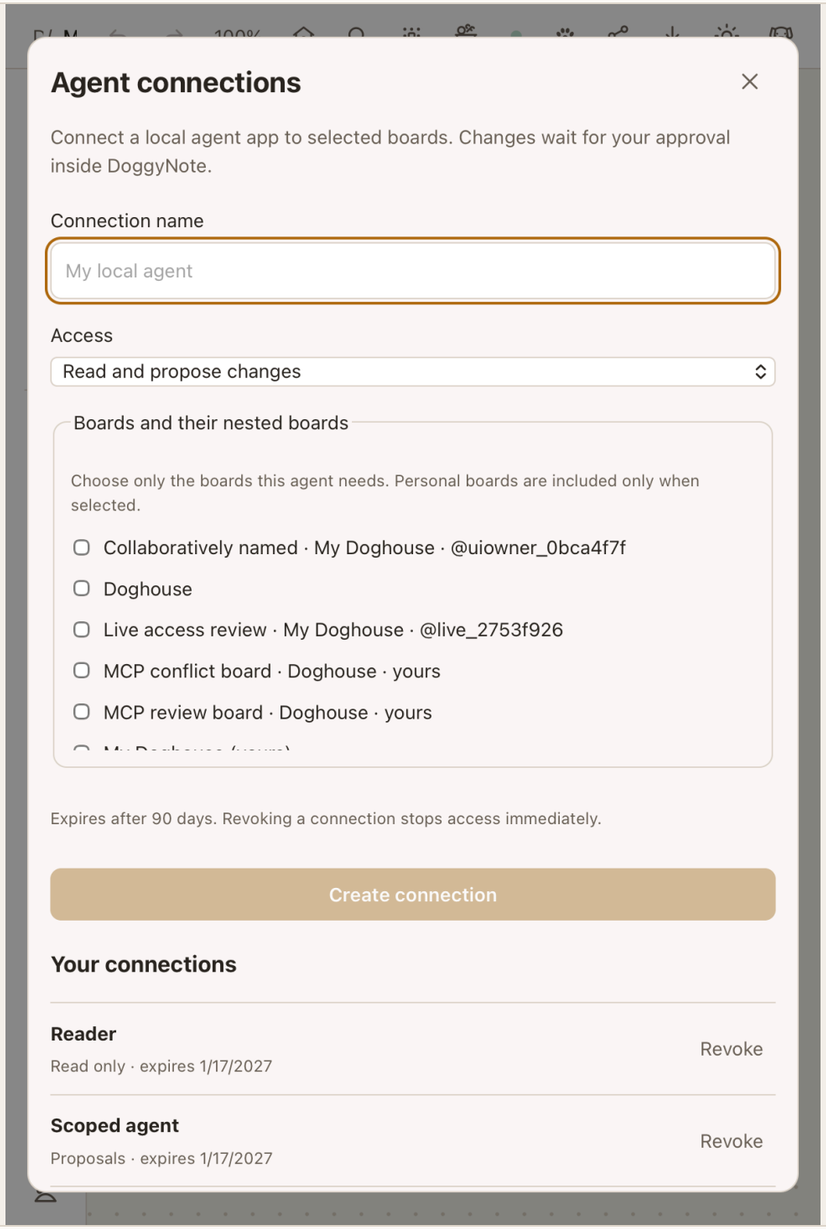

Fido opened an editing invitation, signed in, joined the board and added a contribution.

This is the joined-board outcome; the join form was not captured.

Choose an agent connection scope

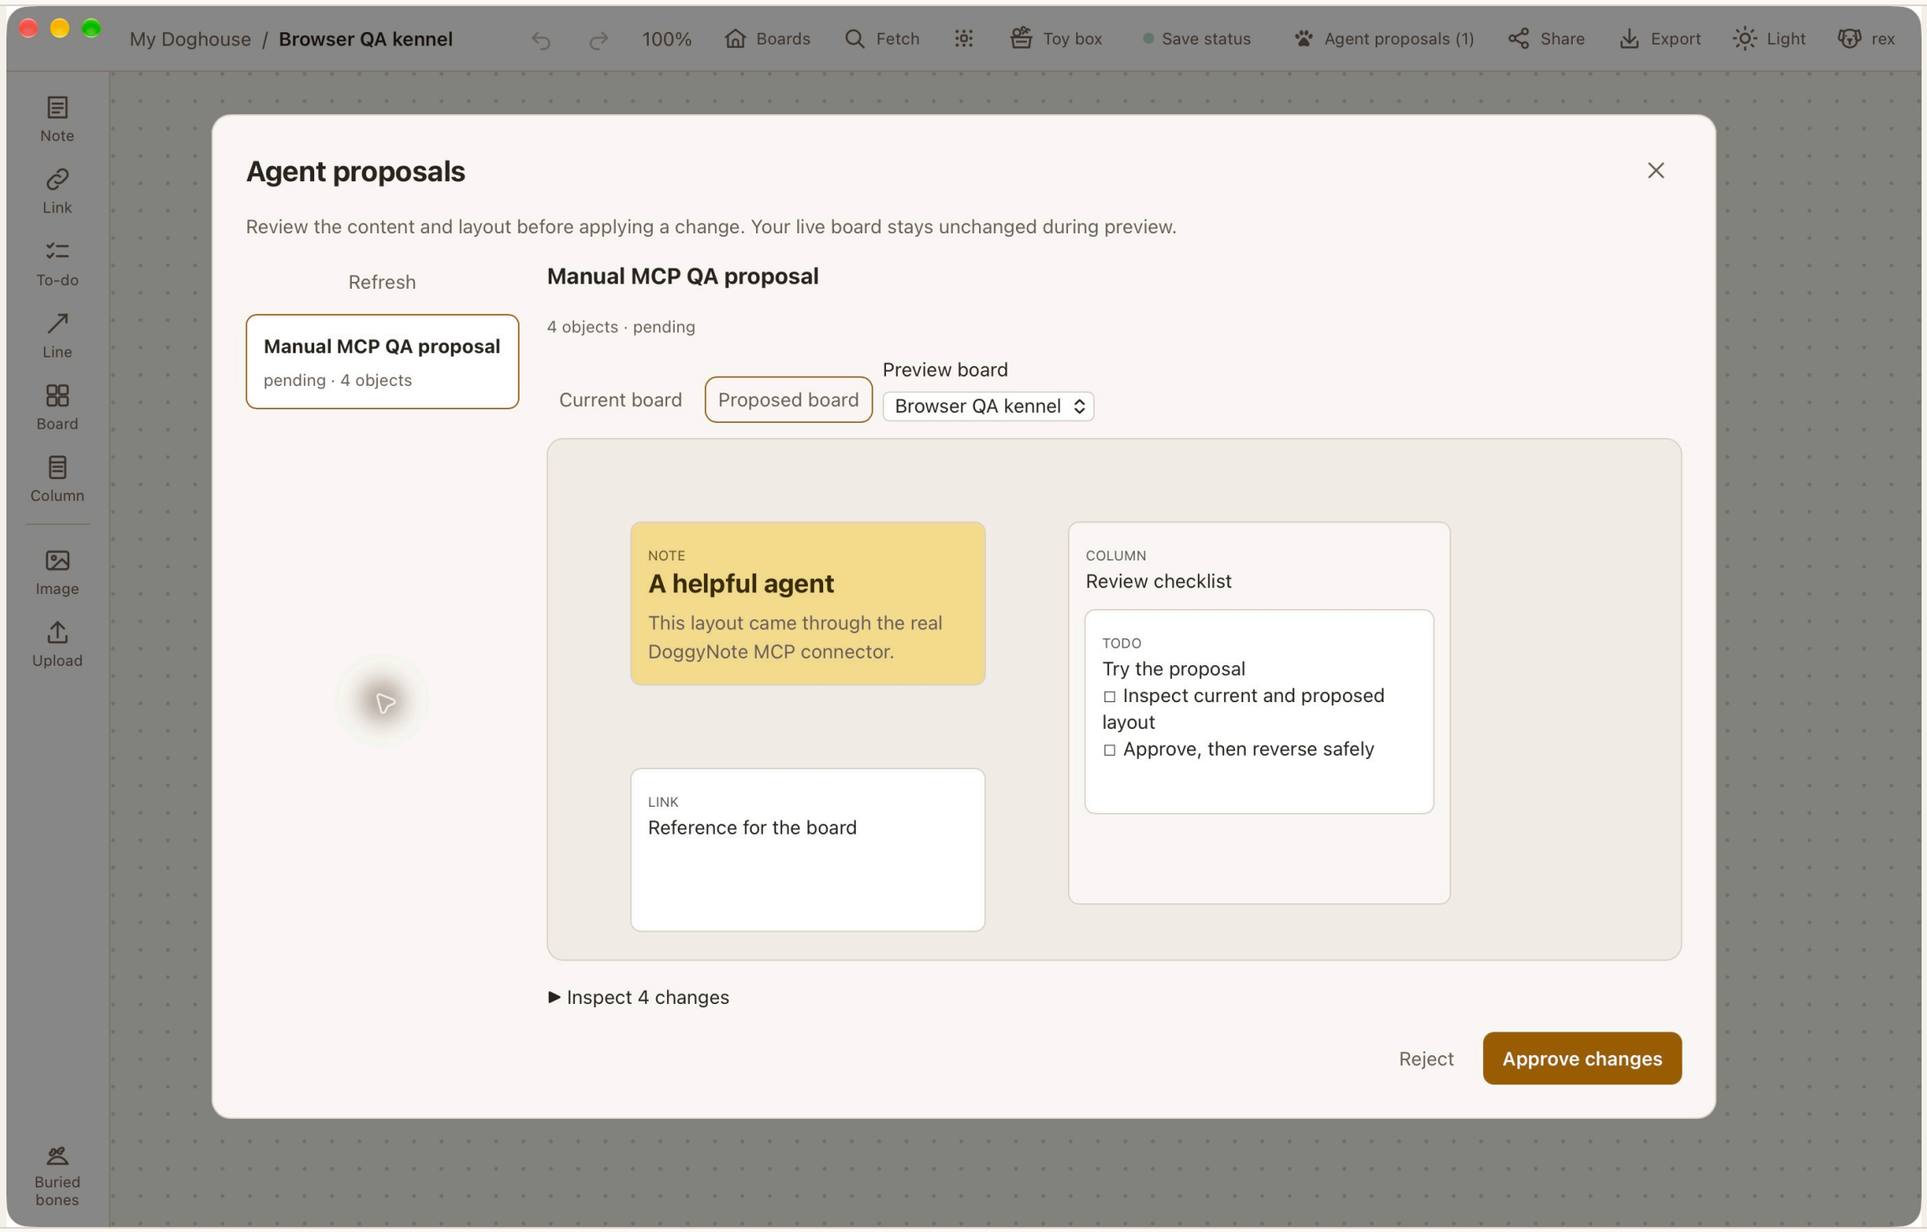

Connections name their access mode and selected boards. The token itself is excluded from this pack.

Review the board labels and the distinction between read-only and proposals.

Preview a proposed layout

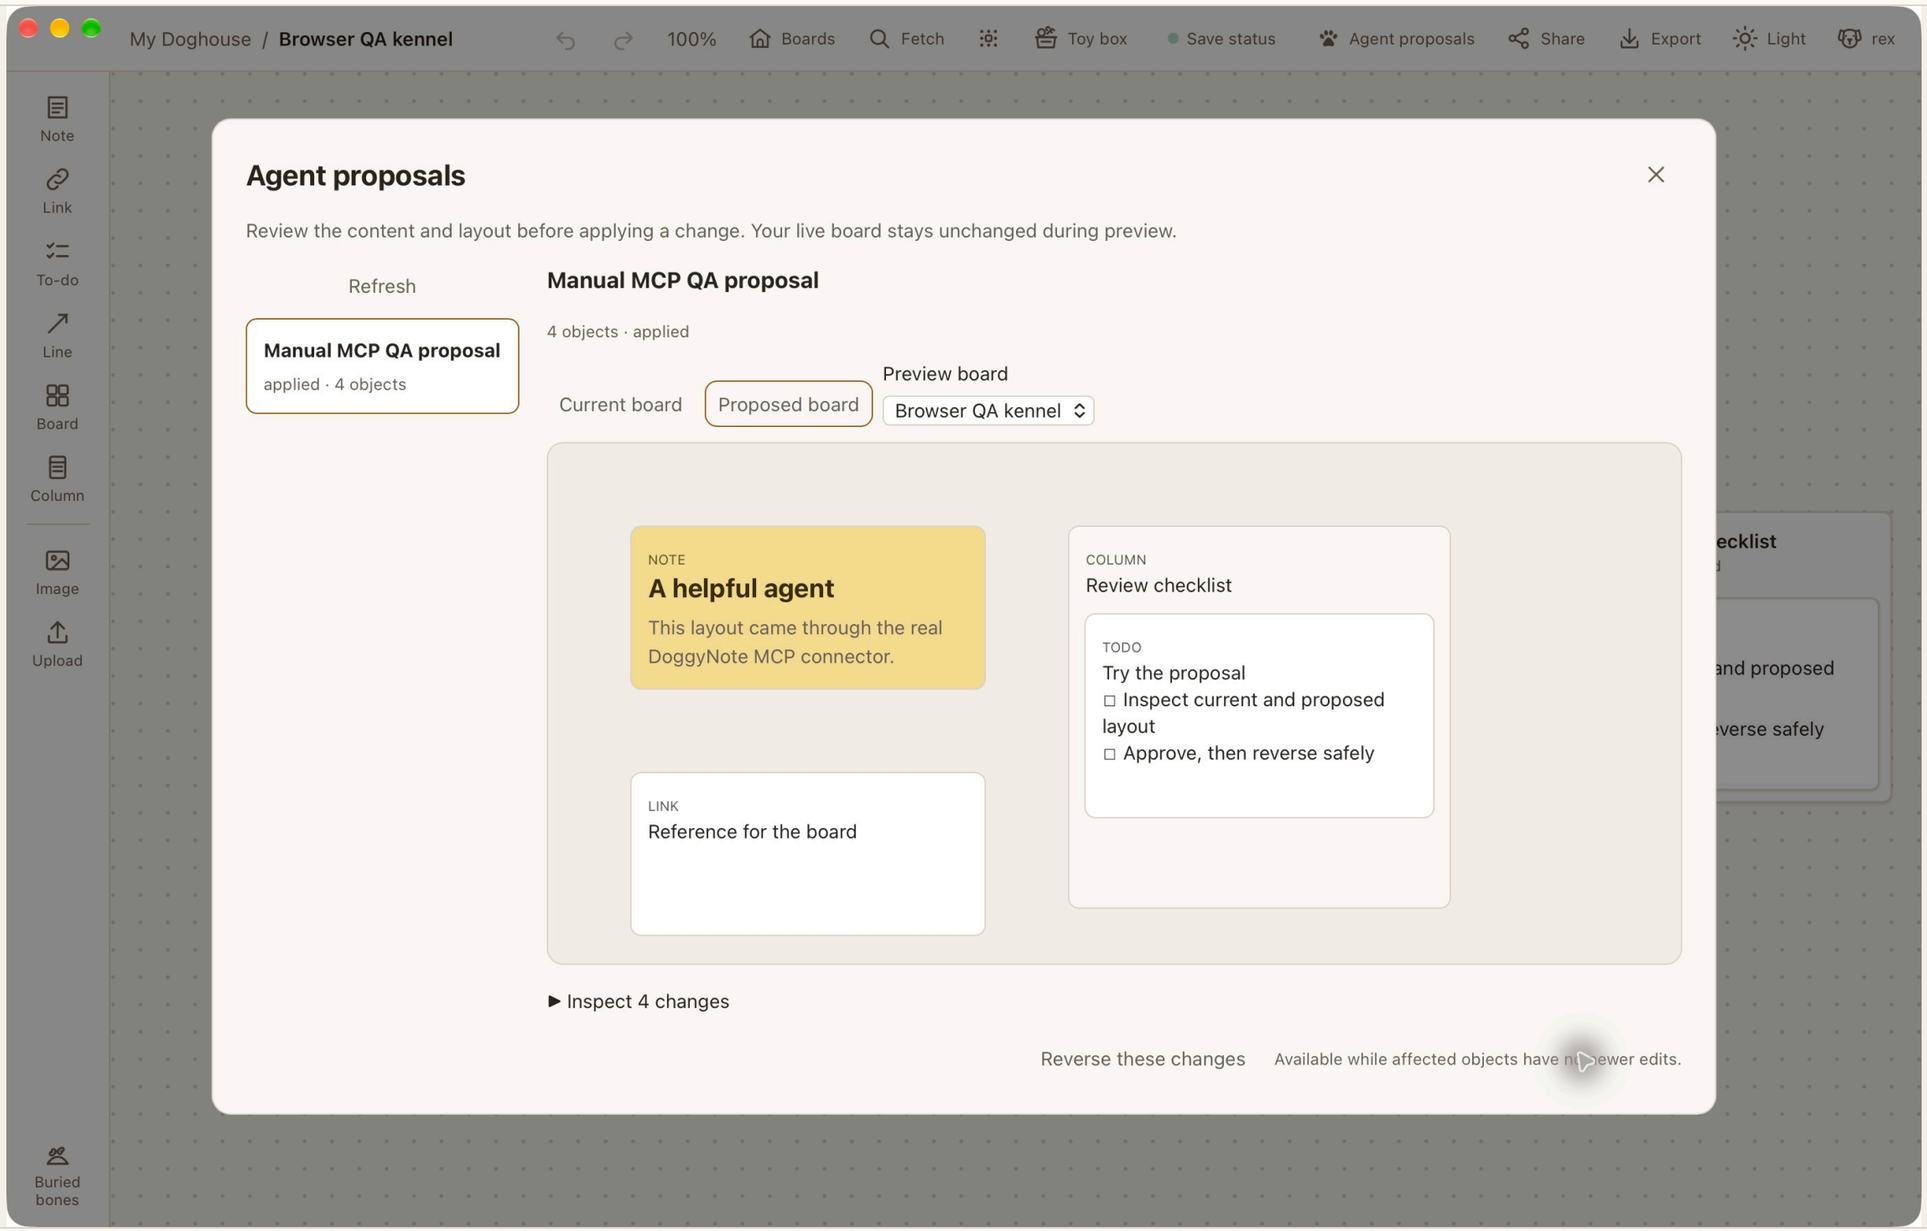

A real SDK client staged four objects. The native app displayed the proposed board before approval.

This earlier native capture precedes the final preview text-contrast fix; see the final browser views below.

Approve and see the live cards

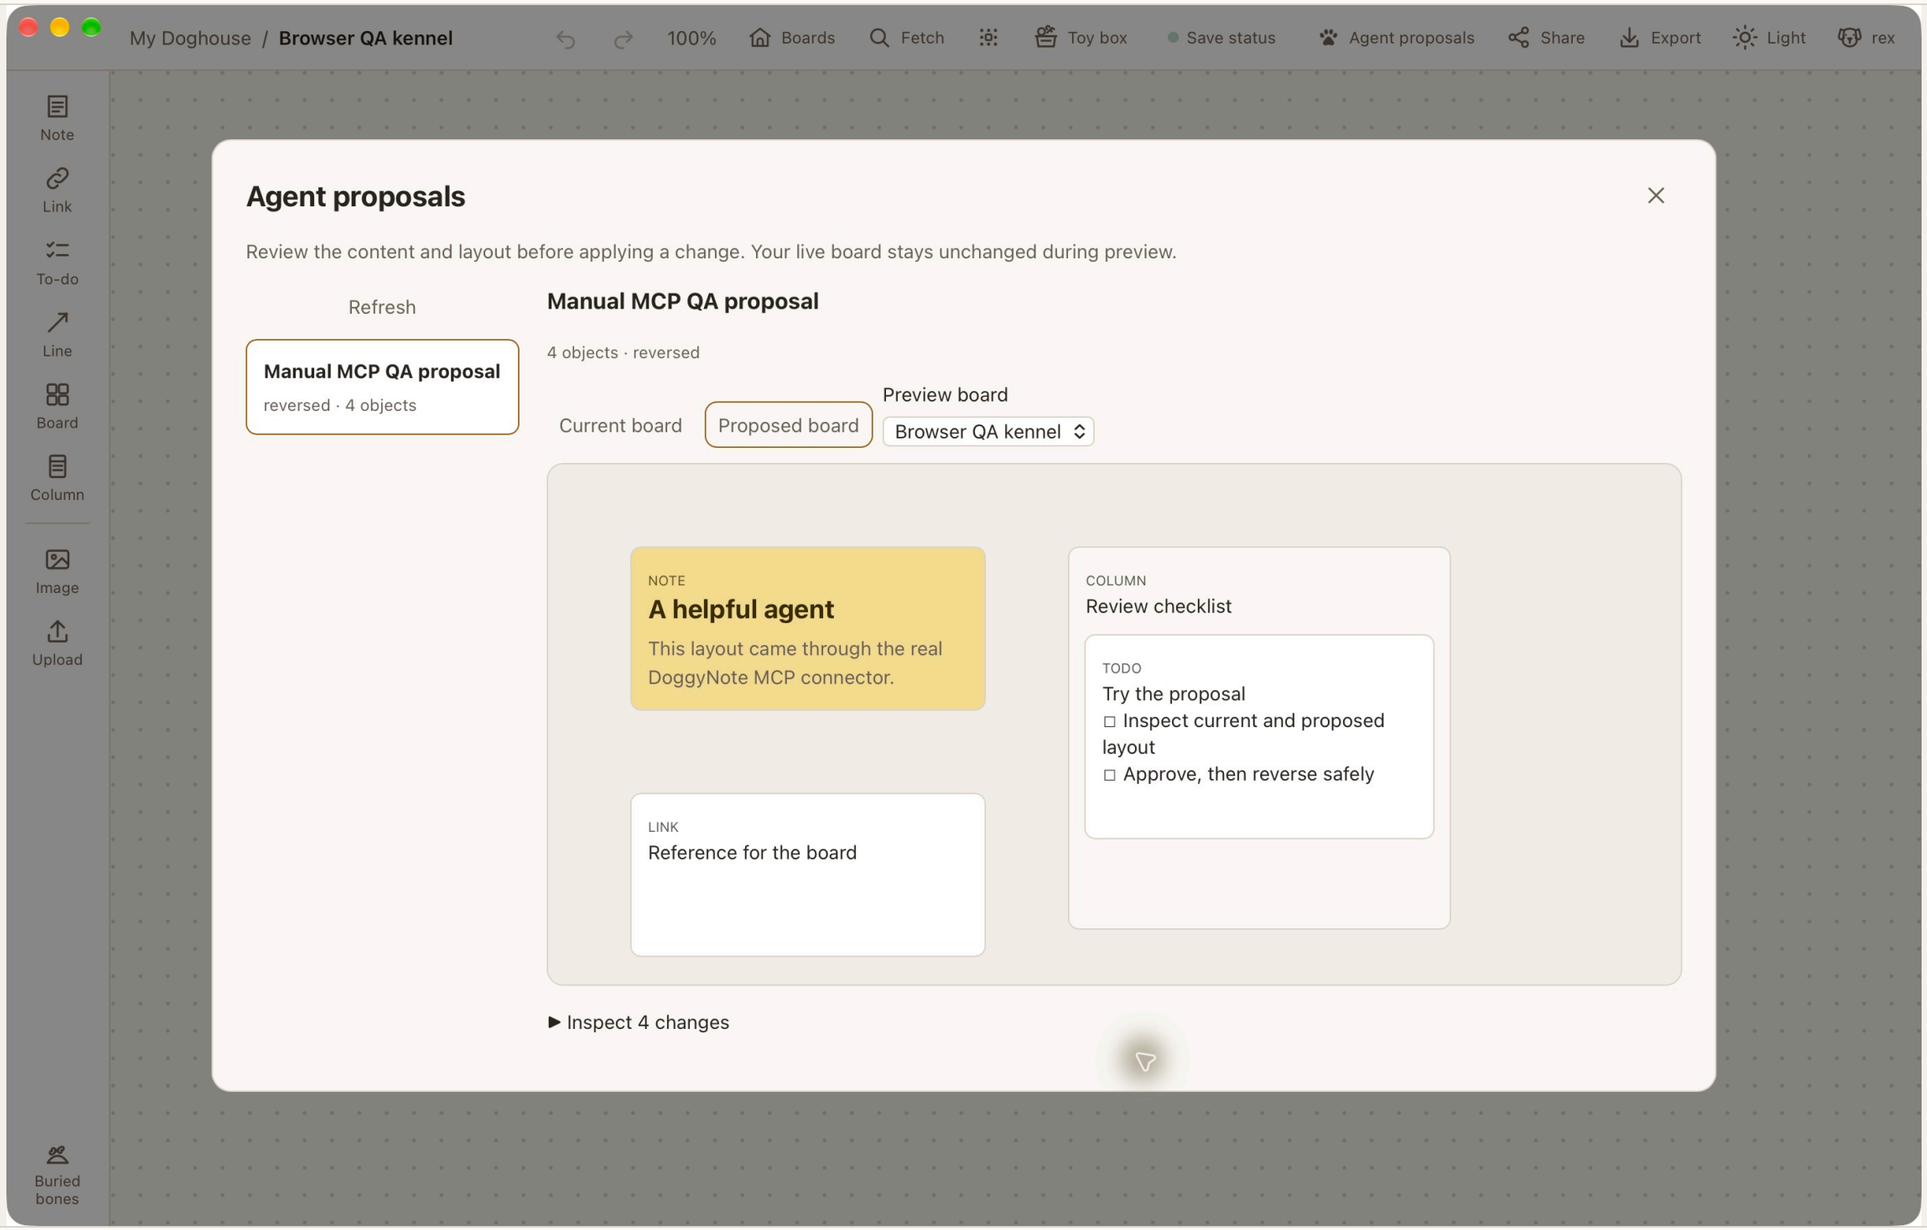

After approval, the note, column, checklist and link appeared on the live board.

The proposal has now changed the board, rather than only its preview.

Reverse the applied proposal

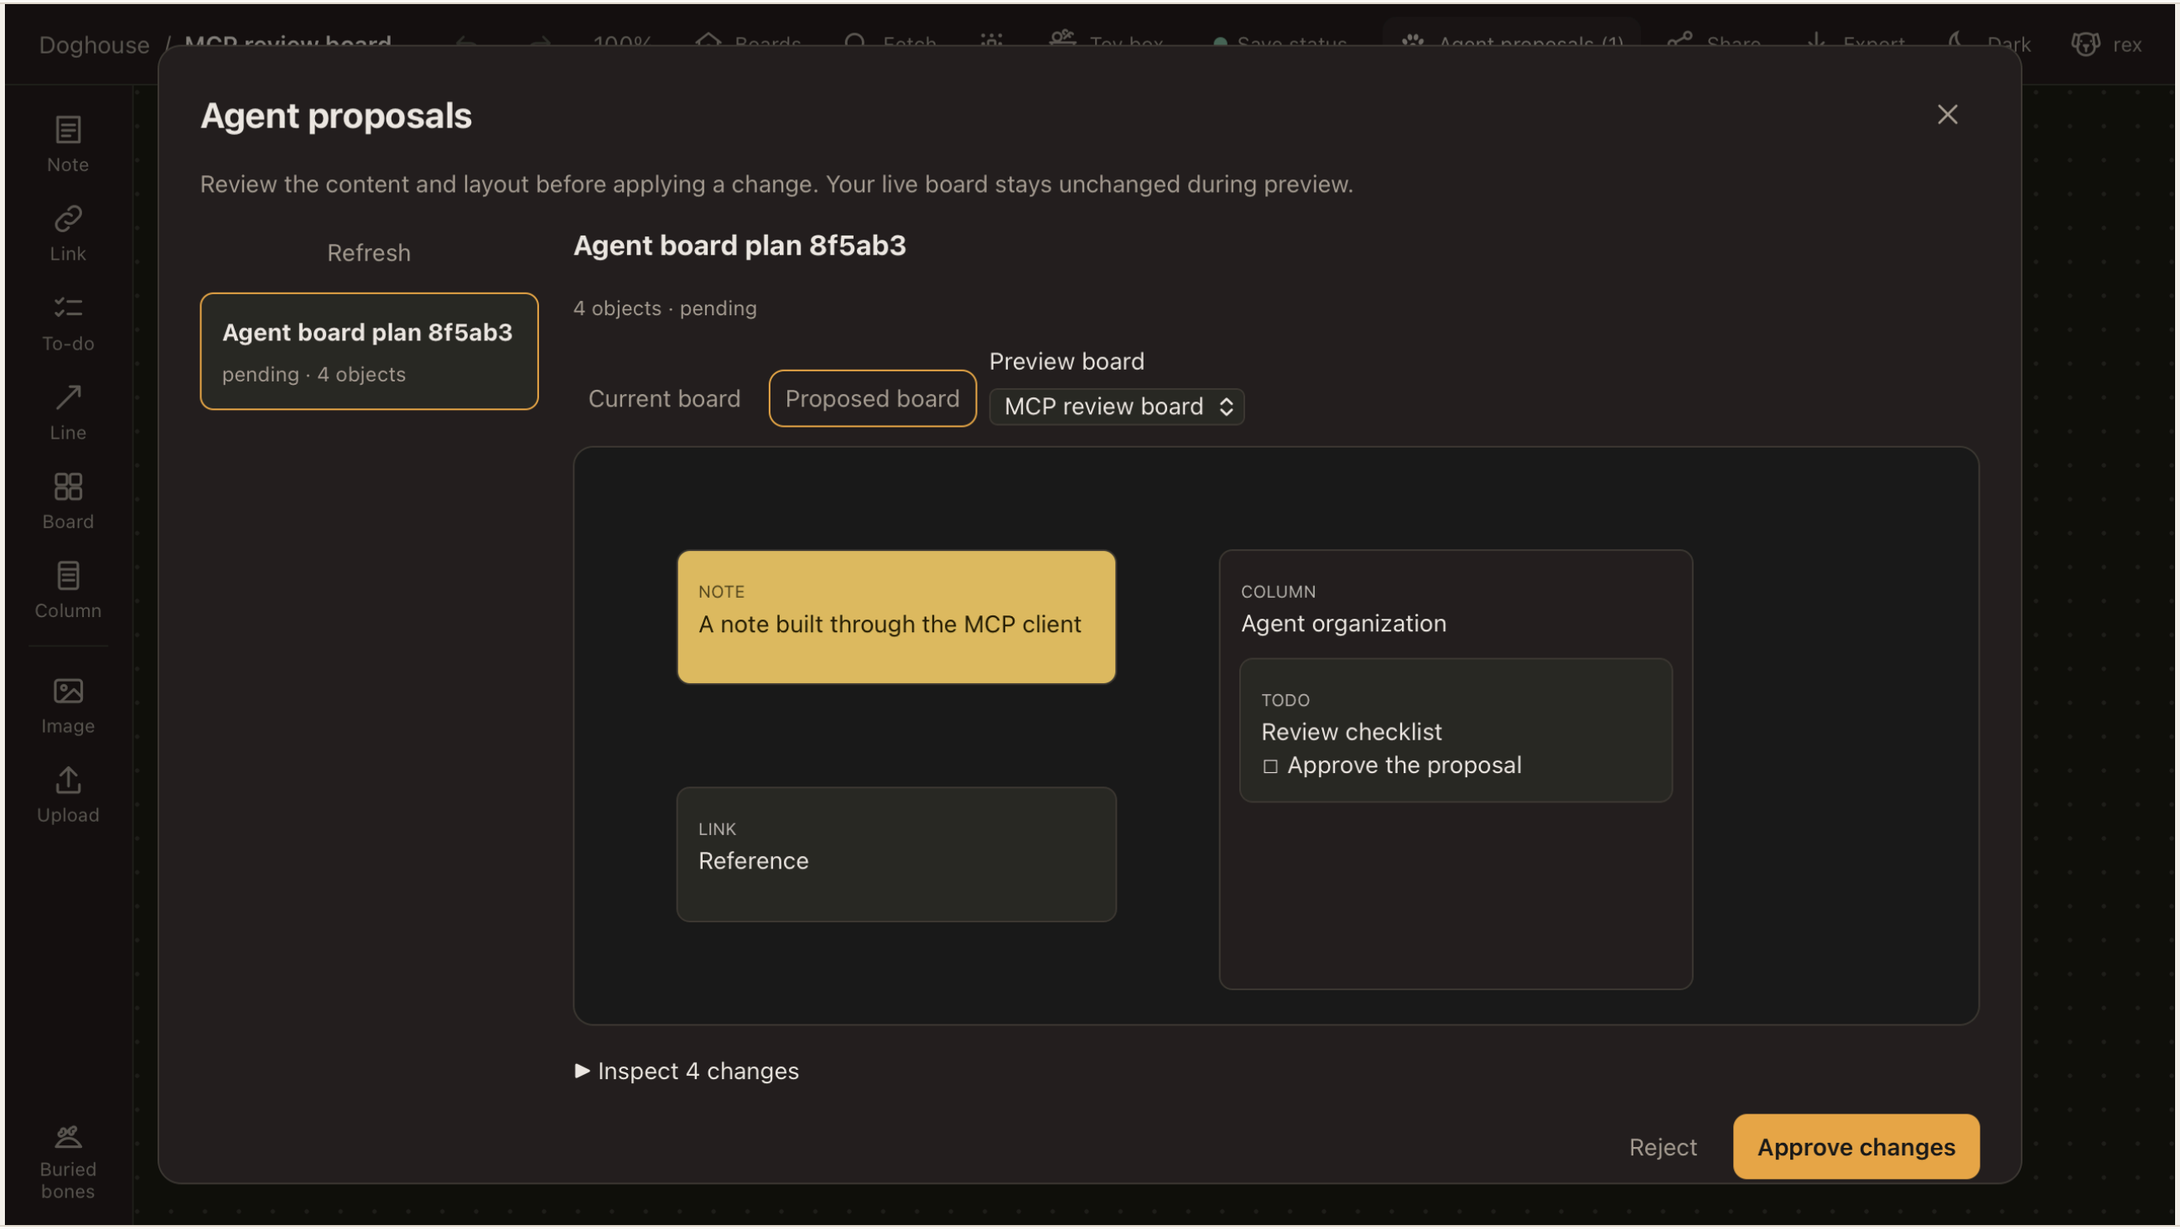

Reversing the proposal removed its objects from the live board; the proposal status became reversed.

Review whether the reversal result is understandable.

Review the final dark preview

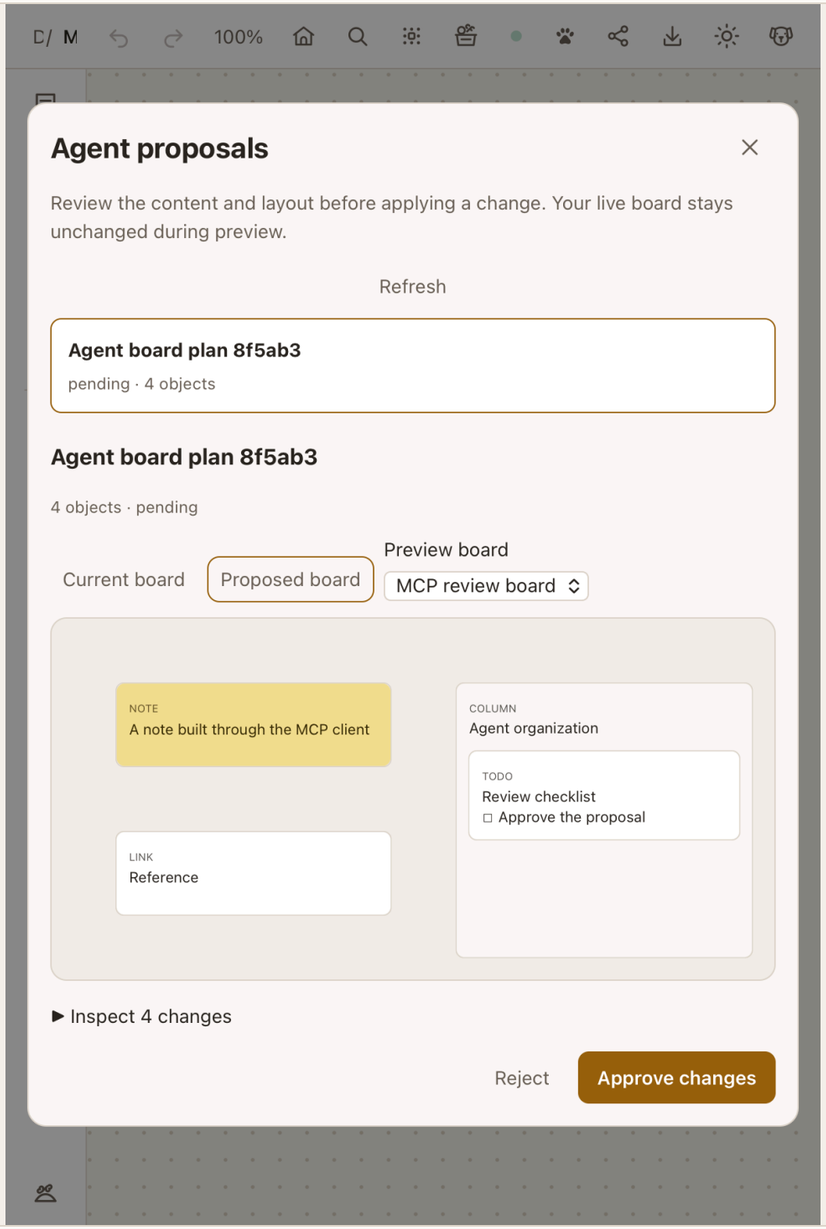

The final browser capture shows the gold note with the corrected text color and the spaced column heading.

Compare the card contrast and approval action placement.

Review the final narrow preview

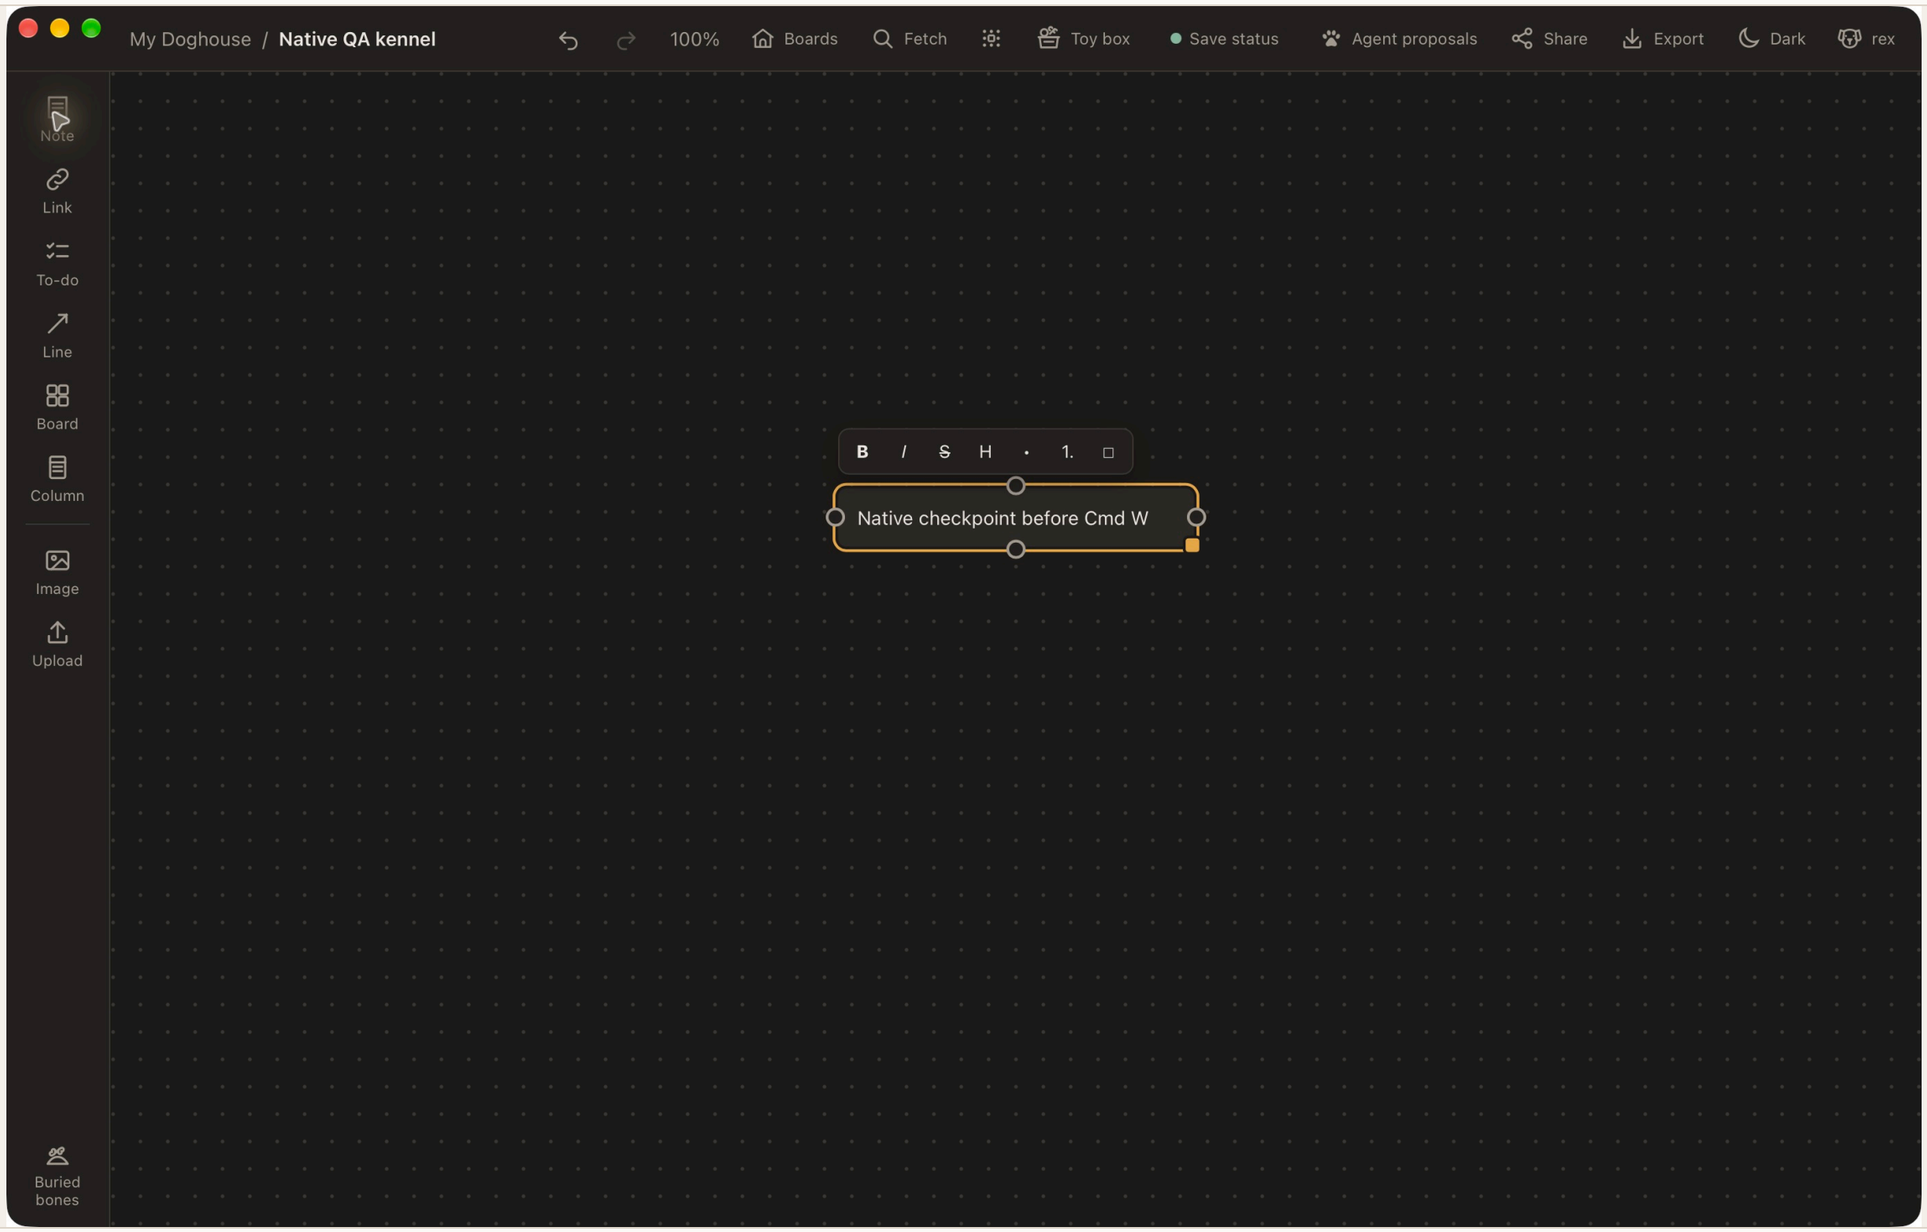

The same proposal fits in a narrow light-theme window without clipping its cards.

Review the stacked layout, board selector and approval controls.

Leave a complete note in progress

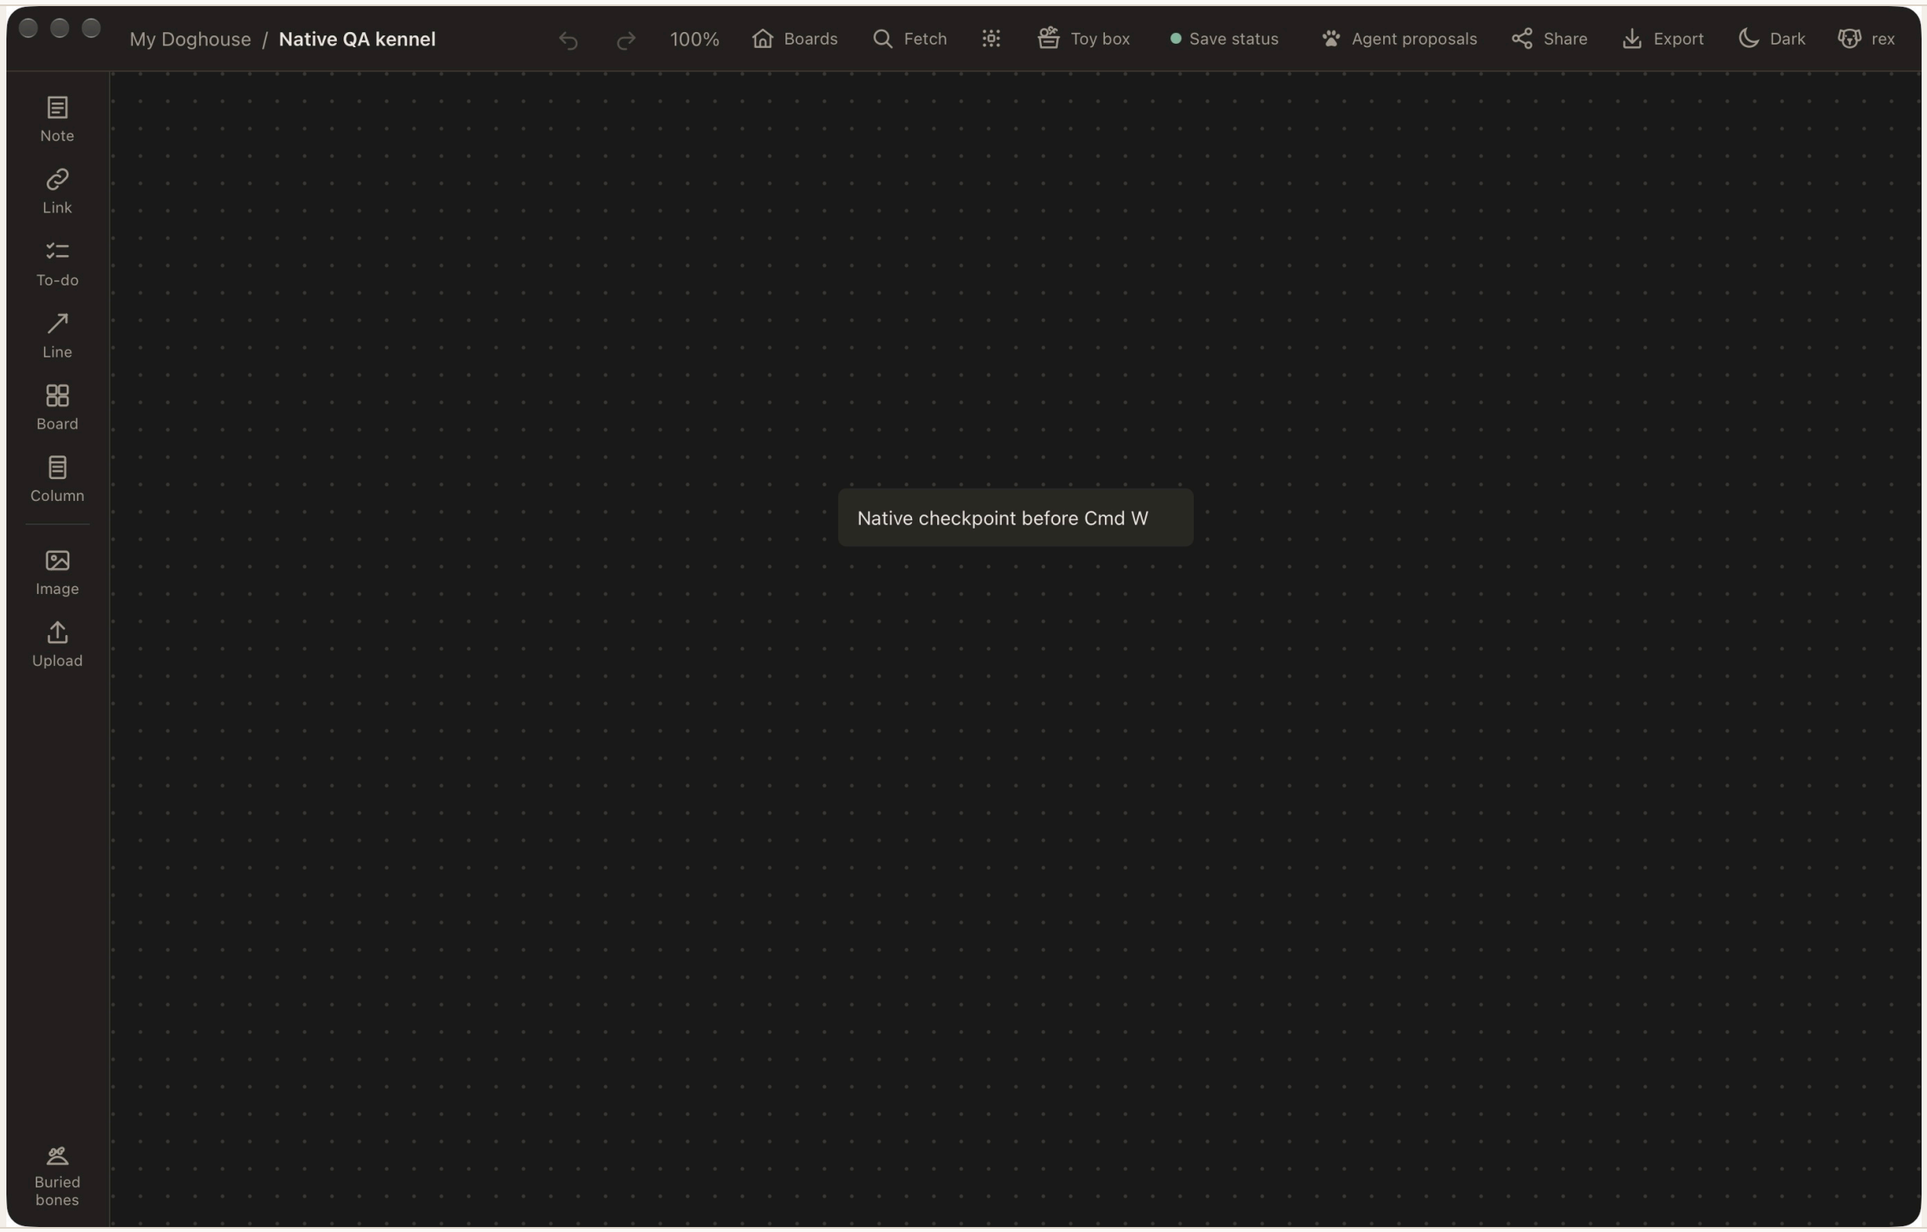

The full note was observed in the editor before closing the window.

This is a captured state, not a recording of the close gesture.

Reopen after Cmd+W

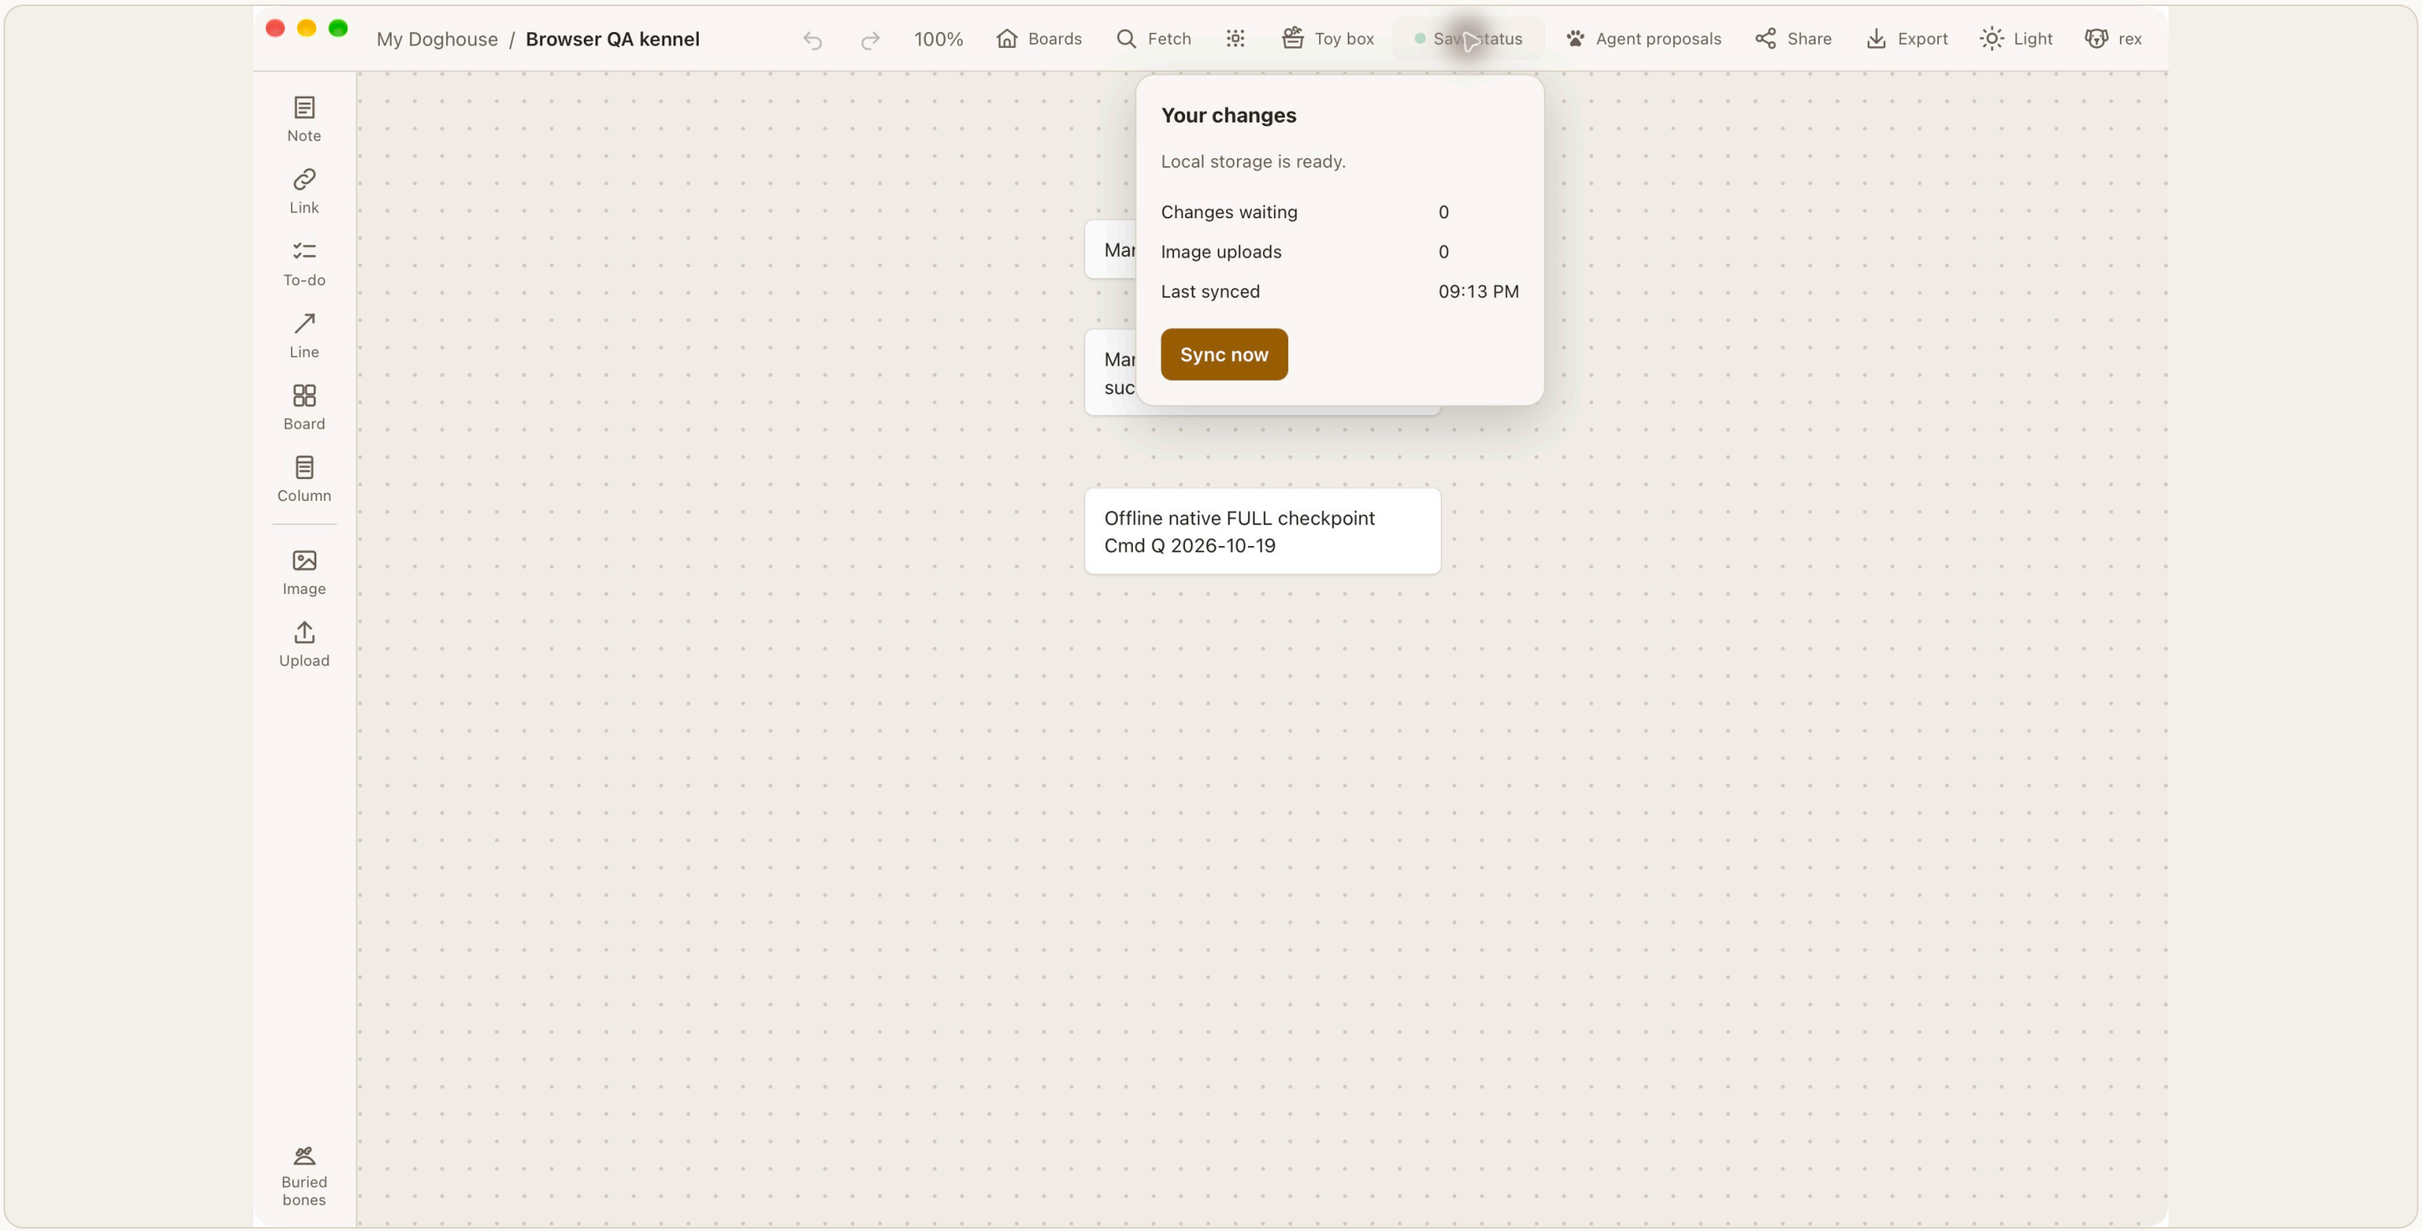

The complete note remained visible after Cmd+W and reopening the app.

Text preservation was also checked with the red window-close button.

Inspect the final save details

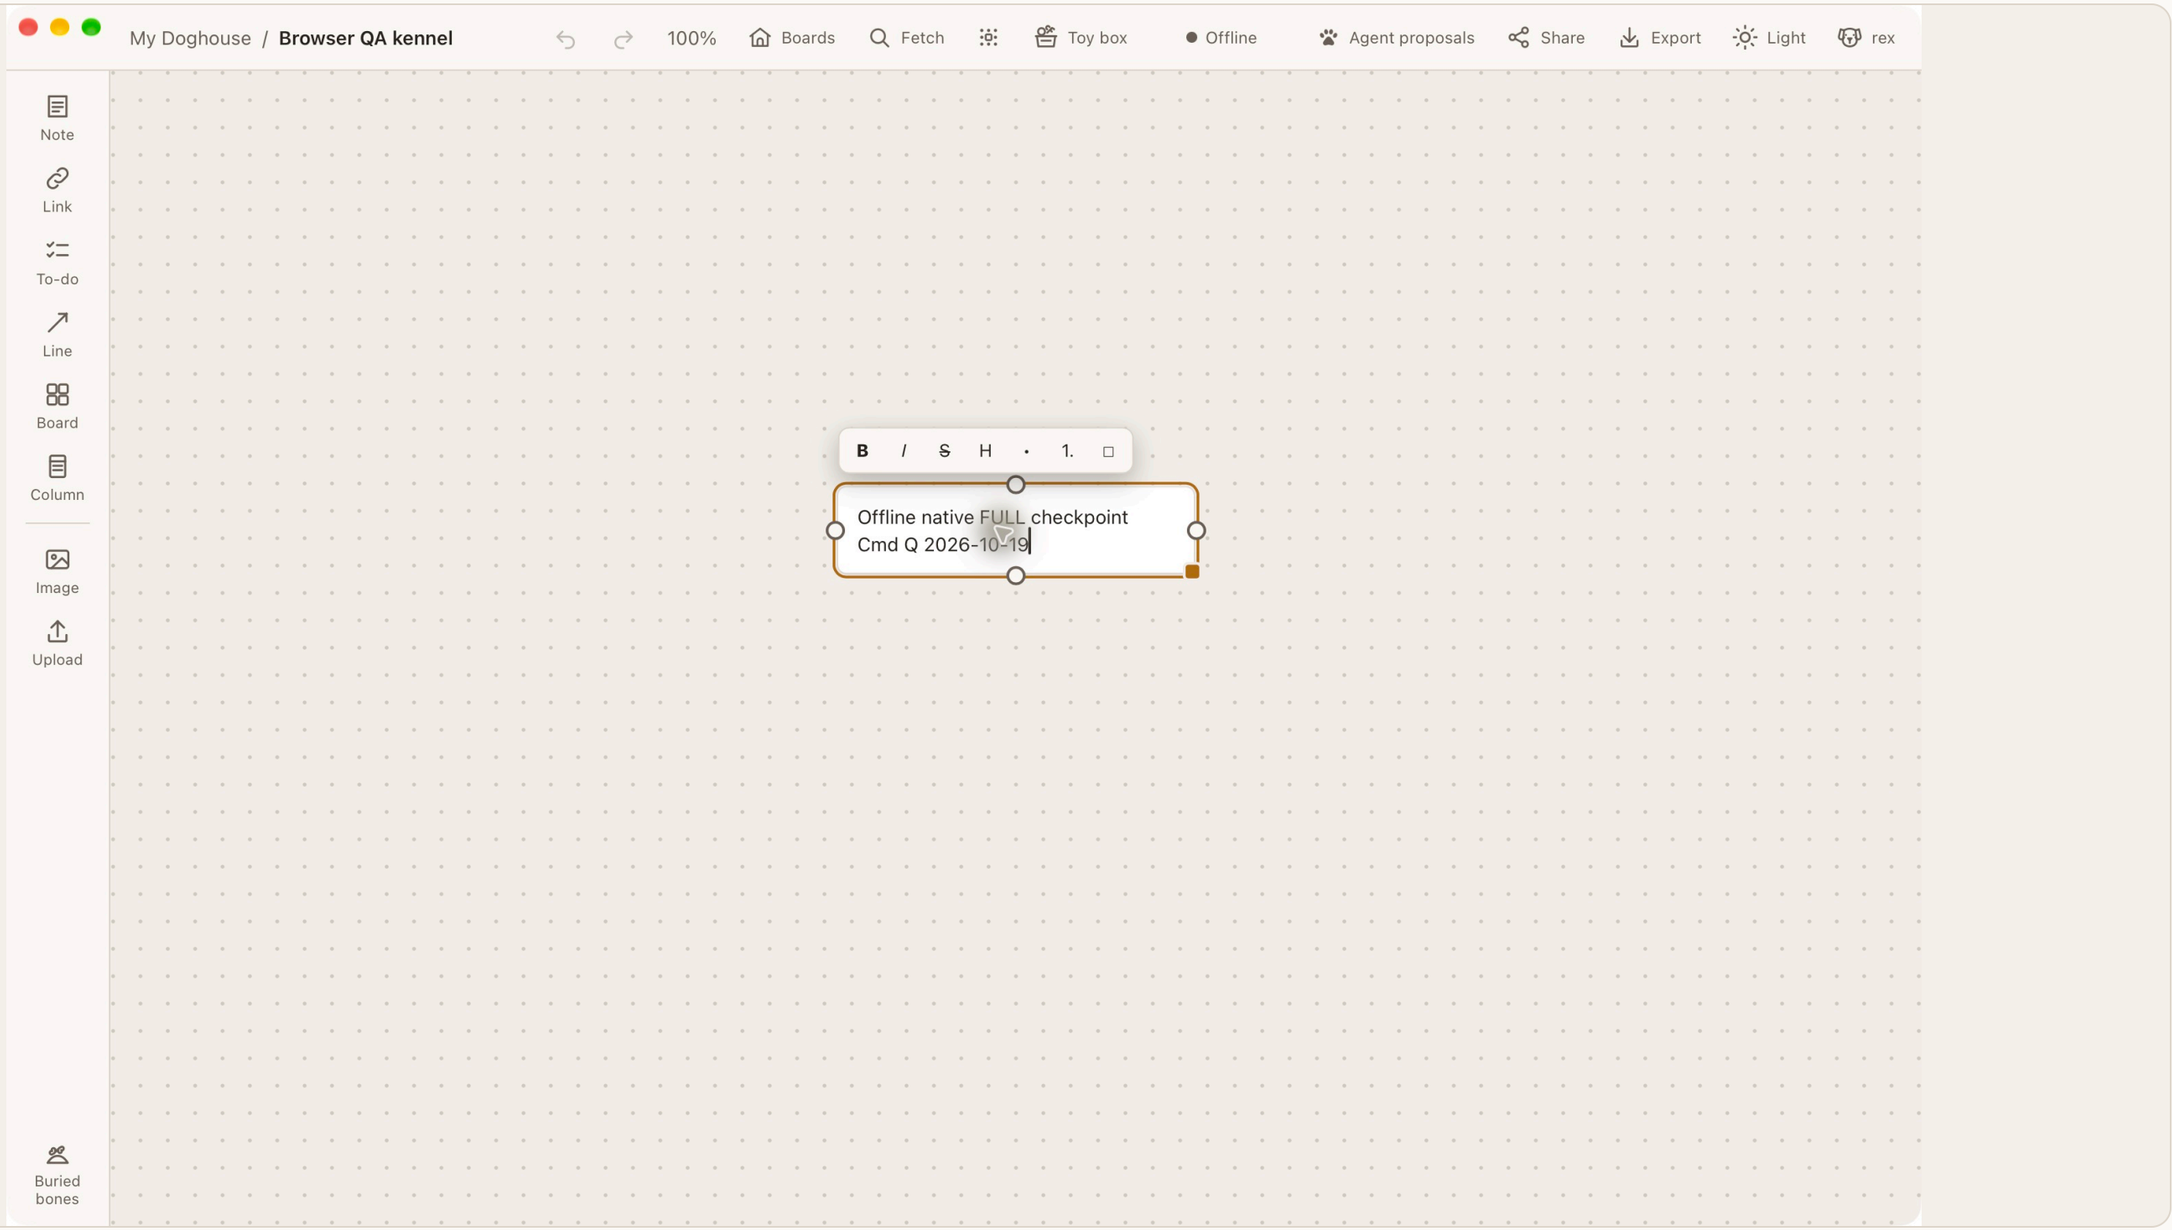

The latest native build shows the shared contributions and zero waiting changes or image uploads.

Review the quiet Save status control and the detail panel.

Keep typing while offline

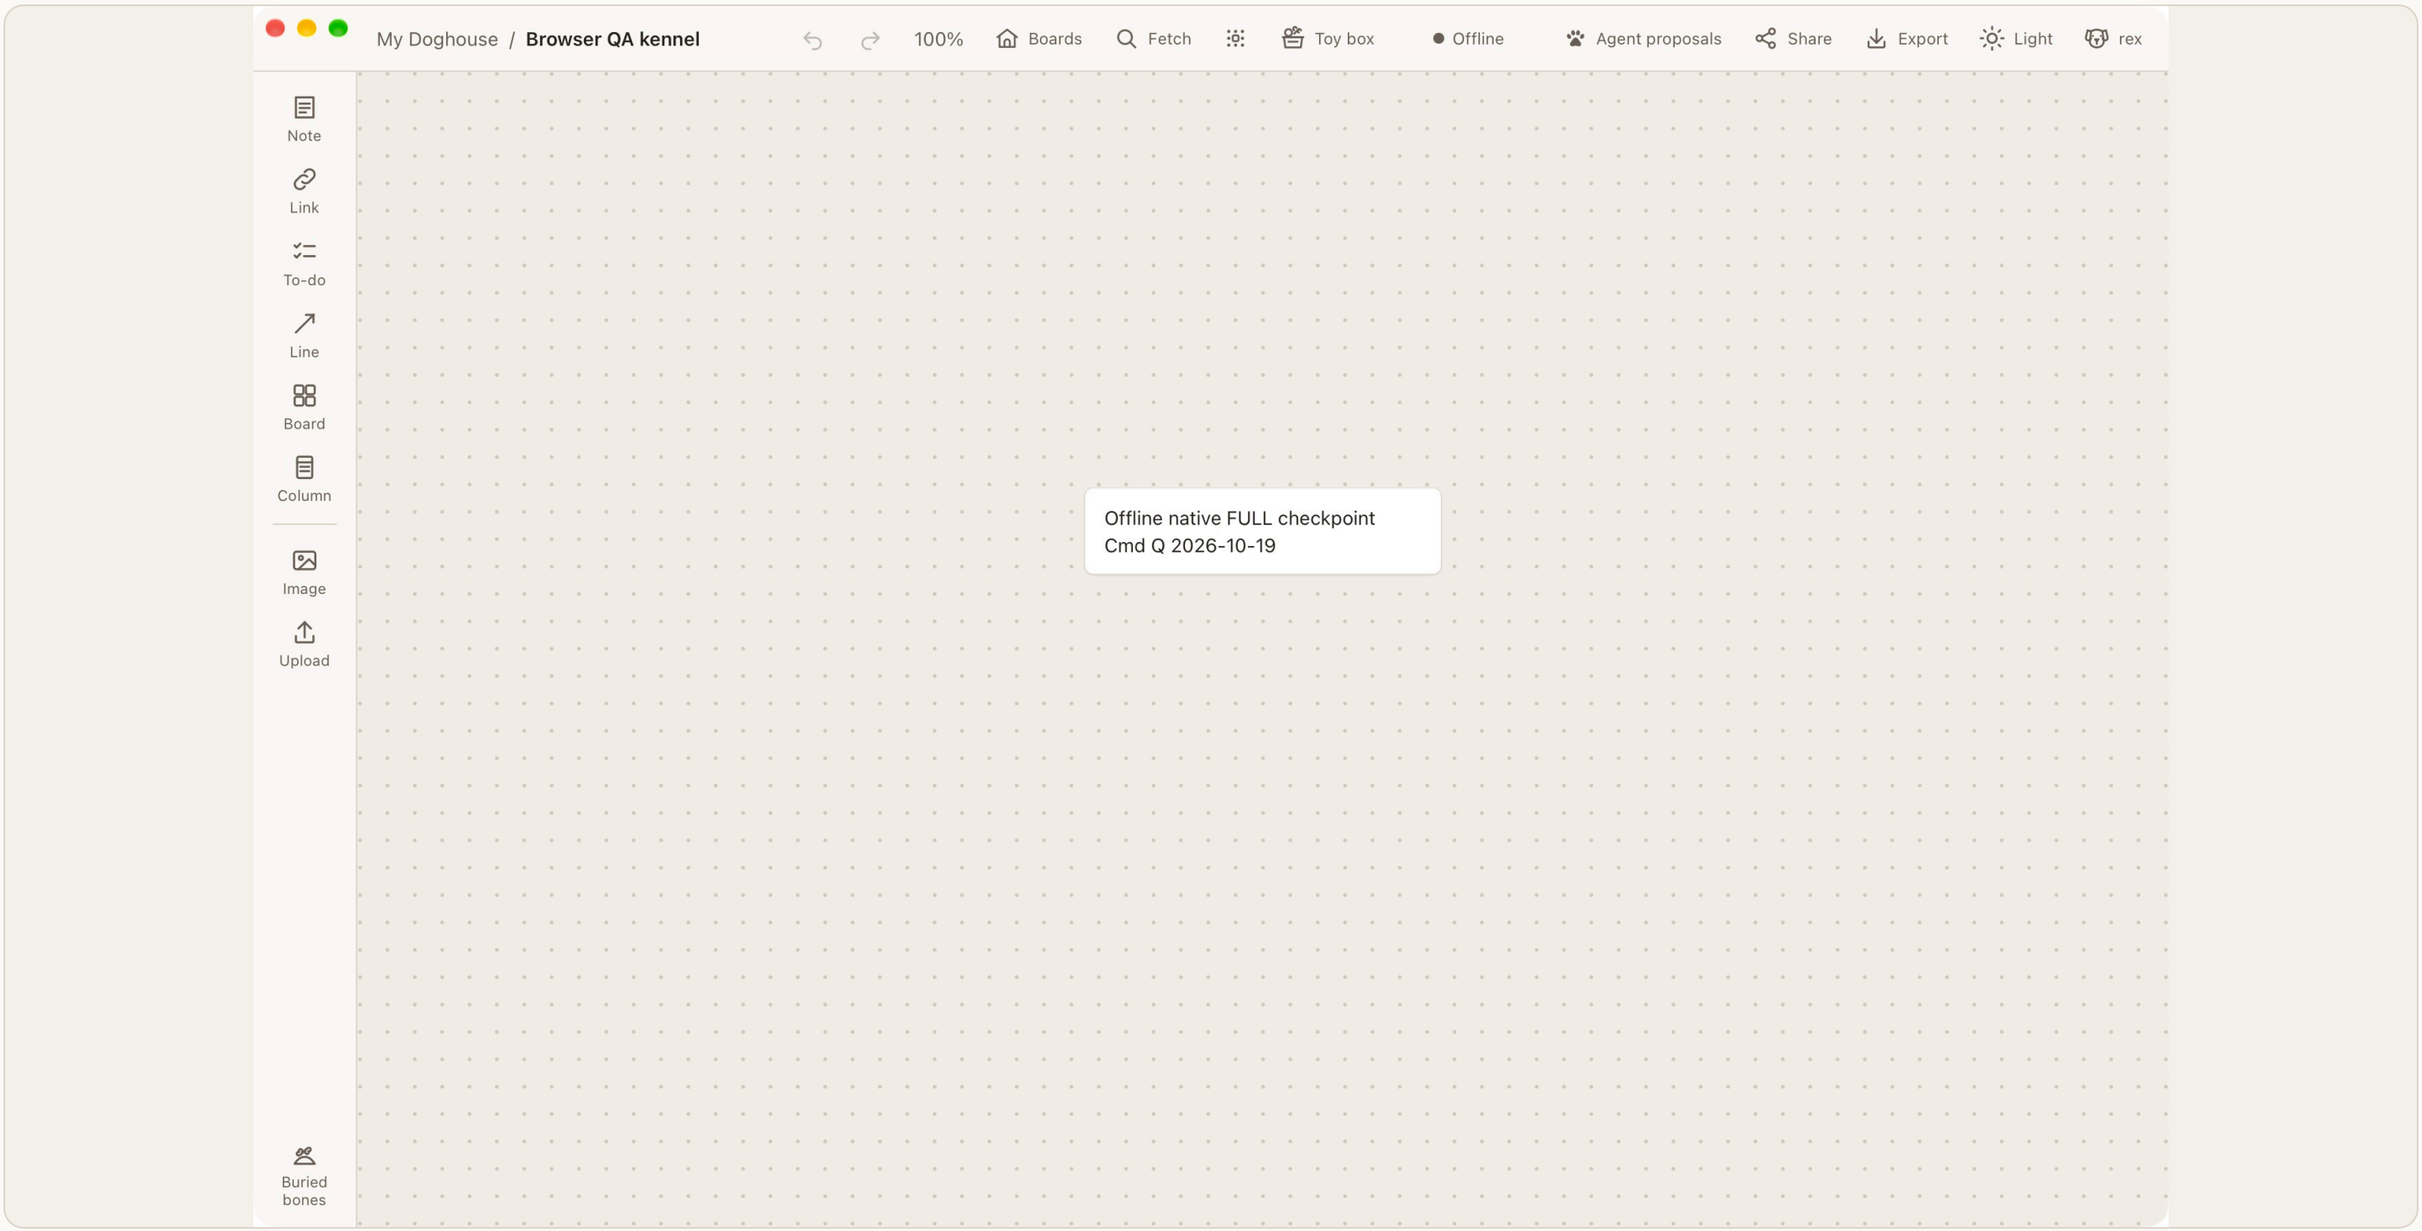

The full offline note is visible in the active editor while the status reads Offline.

The local test server was stopped; this was a real offline check.

Reopen while still offline

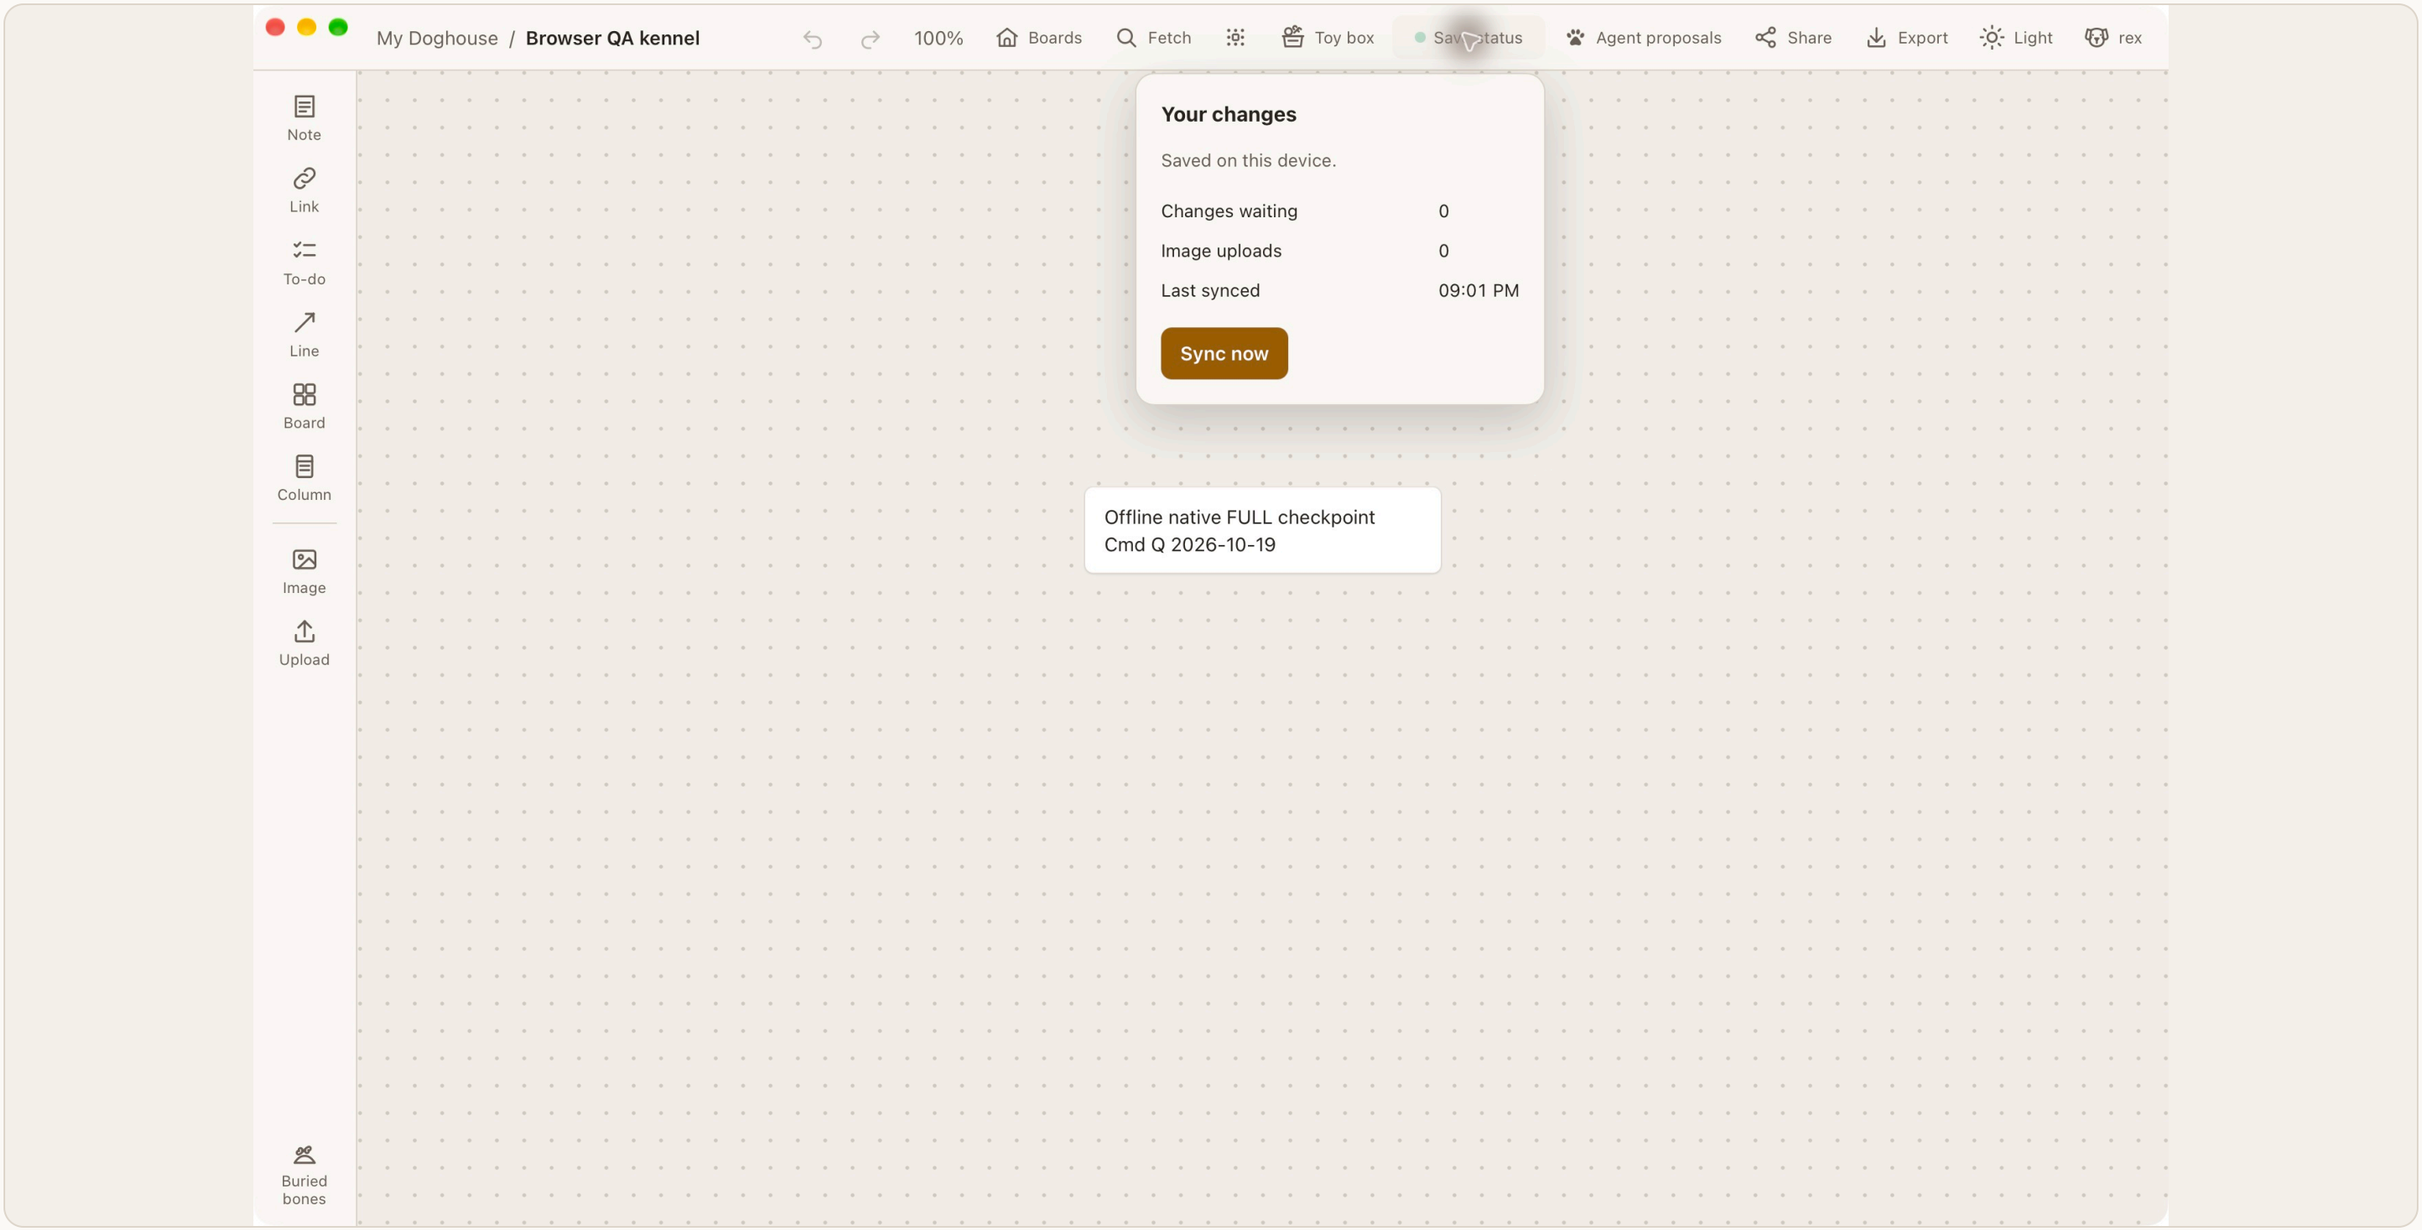

The app was quit and reopened before the server returned. The complete note survived.

Compare the note text with the preceding screenshot.

Reconnect and finish syncing

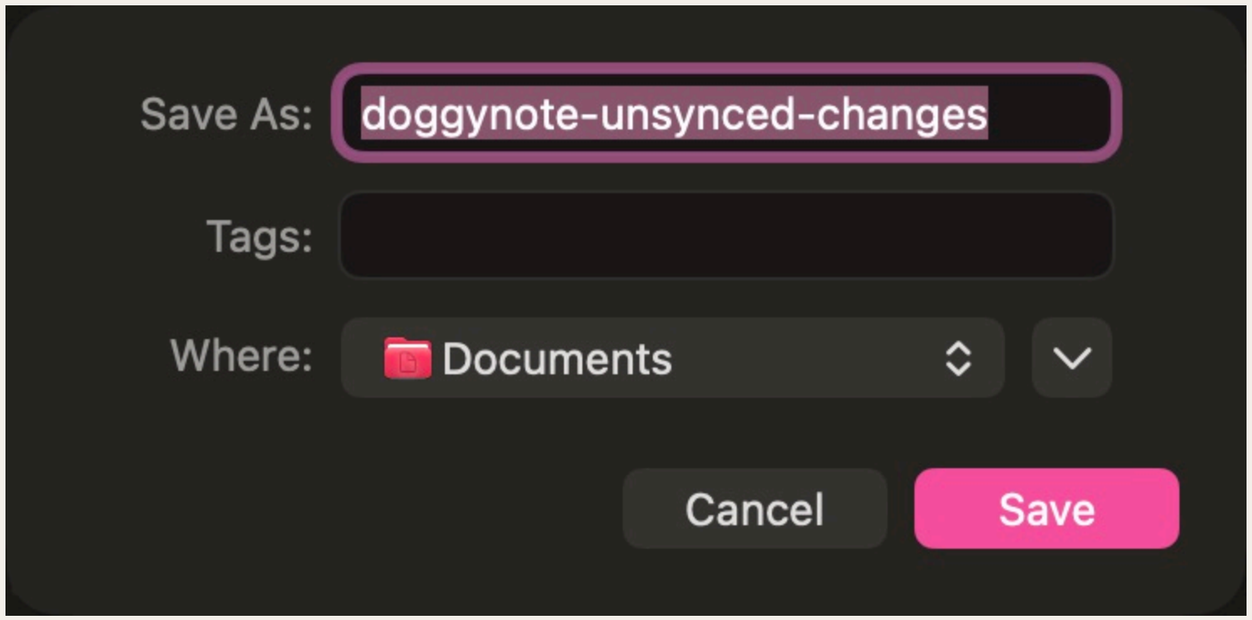

After restarting the same local server, the note stayed intact and pending work reached zero.

Review the transition back to the quiet save state.

Export a recovery copy

Download unsynced changes opens a native JSON Save dialog. Cancel returns to the editor and keeps the recovery copy.

The dialog is captured here; the preceding access-change notification is not.
